CHAPTER 1

Introduction

Python implementation of standard from IAPWS (http://www.iapws.org/release.html).

- Home: https://github.com/jjgomera/iapws
- Author: Juan José Gómez Romera <jjgomera@gmail.com>
- License: GPL-3
- Documentation: http://iapws.readthedocs.io/
CHAPTER 2

Dependences

- python 2x, 3x, compatible with both versions
- Numpy-scipy: library with mathematic and scientific tools
In debian you can find in official repositories in jessie, testing and sid. In ubuntu it’s in official repositories from ubuntu saucy (13.10). In other system you can install using pip:

```
pip install iapws
```

or directly cloning the github repository:

```
git clone https://github.com/jjgomera/iapws.git
```

and adding the folder to a python path.
This module implements almost the full set of standards:

Releases:

- **R1-76(2014):** Revised Release on the Surface Tension of Ordinary Water Substance, `iapws._iapws._Tension()`
- **R2-83(1992):** Release on the Values of Temperature, Pressure and Density of Ordinary and Heavy Water Substances at their Respective Critical Points, `iapws._iapws()`
- **R4-84(2007):** Revised Release on Viscosity and Thermal Conductivity of Heavy Water Substance, `iapws._iapws._D2O_Viscosity(),iapws._iapws._D2O_ThCond()`
- **R5-85(1994):** Release on Surface Tension of Heavy Water Substance, `iapws._iapws._D2O_Tension()`
- **R8-97:** Release on the Static Dielectric Constant of Ordinary Water Substance for Temperatures from 238 K to 873 K and Pressures up to 1000 MPa, `iapws._iapws._Dielectric()`
- **R9-97:** Release on the Refractive Index of Ordinary Water Substance as a Function of Wavelength, Temperature and Pressure, `iapws._iapws._Refractive()`
- **R12-08:** Release on the IAPWS Formulation 2008 for the Viscosity of Ordinary Water Substance, `iapws._iapws._Viscosity()`
- **R13-08:** Release on the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, `iapws.iapws08()`
• R14-08(2011): Revised Release on the Pressure along the Melting and Sublimation Curves of Ordinary Water Substance, `iapws._iapws._Melting_Pressure()`, `iapws._iapws._Sublimation_Pressure()`

• R15-11: Release on the IAPWS Formulation 2011 for the Thermal Conductivity of Ordinary Water Substance, `iapws._iapws._ThCond()`

Supplementary Releases:

• SR1-86(1992): Revised Supplementary Release on Saturation Properties of Ordinary Water Substance, `iapws.iapws95.MEoS._Liquid_Density()`, `iapws.iapws95.MEoS._Vapor_Density()`, `iapws.iapws95.MEoS._Vapor_Pressure()`

• SR2-01(2014): Revised Supplementary Release on Backward Equations for Pressure as a Function of Enthalpy and Entropy p(h,s) for Regions 1 and 2 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, `iapws.iapws97._Backward1_P_hs()`, `iapws.iapws97._Backward2_P_hs()`

• SR3-03(2014): Revised Supplementary Release on Backward Equations for the Functions T(p,h), v(p,h), and T(p,s), v(p,s) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, `iapws.iapws97._Backward3_T_Ph()`, `iapws.iapws97._Backward3_T_Ps()`, `iapws.iapws97._Backward3_v_Ph()`, `iapws.iapws97._Backward3_v_Ps()`

• SR4-04(2014): Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, `iapws.iapws97._Backward3_P_hs()`

• SR5-05(2016): Revised Supplementary Release on Backward Equations for Specific Volume as a Function of Pressure and Temperature v(p,T) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, `iapws.iapws97._Backward3_v_PT()`

• SR6-08(2011): Revised Supplementary Release on Properties of Liquid Water at 0.1 MPa, `iapws._iapws._Liquid()`

• SR7-09: Supplementary Release on a Computationally Efficient Thermodynamic Formulation for Liquid Water for Oceanographic Use, `iapws.iapws08.SeaWater._waterSupp()`

Guidelines:

• G1-90: Electrolytic Conductivity (Specific Conductance) of Liquid and Dense Supercritical Water from 0°C to 800°C and Pressures up to 1000 MPa, `iapws._iapws._Conductivity()`

• G2-90(1994): Solubility of Sodium Sulfate in Aqueous Mixtures of Sodium Chloride and Sulfuric Acid from Water to Concentrated Solutions, from 250 °C to 350 °C, `iapws.iapws08._solNa2SO4()`

• G3-00(2012): Revised Guideline on the Critical Locus of Aqueous Solutions of Sodium Chloride, `iapws.iapws08._critNaCl()`

• G4-01: Guideline on the IAPWS Formulation 2001 for the Thermodynamic Properties of Ammonia-Water Mixtures, `iapws.ammonia()`

• G5-01(2016): Guideline on the Use of Fundamental Physical Constants and Basic Constants of Water, `iapws._iapws()`

• G6-03: Guideline on the Tabular Taylor Series Expansion (TTSE) Method for Calculation of Thermodynamic Properties of Water and Steam Applied to IAPWS-95 as an Example (Not implemented)

• G7-04: Guideline on the Henry’s Constant and Vapor-Liquid Distribution Constant for Gases in H2O and D2O at High Temperatures, `iapws._iapws._Henry()`, `iapws._iapws._Kvalue()`
• G8-10: Guideline on an Equation of State for Humid Air in Contact with Seawater and Ice, Consistent with the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, \texttt{iapws.humidAir().HumidAir()}

• G9-12: Guideline on a Low-Temperature Extension of the IAPWS-95 Formulation for Water Vapor, \texttt{iapws.iapws95.IAPWS95._phiex()}

• G10-15: Guideline on the Thermal Conductivity of Seawater, \texttt{iapws.iapws08._ThCond_SeaWater()}

• G11-15: Guideline on a Virial Equation for the Fugacity of H2O in Humid Air, \texttt{iapws.humidAir._virial()}

• G12-15: Guideline on Thermodynamic Properties of Supercooled Water, \texttt{iapws._iapws._Supercooled()}

• G13-15: Guideline on the Fast Calculation of Steam and Water Properties with the Spline-Based Table Look-Up Method (SBTL) (Not implemented)

• G14-19: Guideline on the Surface Tension of Seawater, \texttt{iapws.iapws08._Tension_SeaWater()}

Advisory Notes:

• AN1-03: Uncertainties in Enthalpy for the IAPWS Formulation 1995 for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use (IAPWS-95) and the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam (IAPWS-IF97)

• AN2-04(2013): Role of Various IAPWS Documents Concerning the Thermodynamic Properties of Ordinary Water Substance

• AN3-07(2018): Thermodynamic Derivatives from IAPWS Formulations, \texttt{iapws._utils.deriv_G()}, \texttt{iapws._utils.deriv_H()}

• AN4-09: Roles of IAPWS and CIPM Standards for the Density of Water

• AN5-13(2016): Industrial Calculation of the Thermodynamic Properties of Seawater, \texttt{iapws.iapws08._waterIF97()}, \texttt{iapws.iapws08._Tb()}, \texttt{iapws.iapws08._Tf()}, \texttt{iapws.iapws08._Triple()}, \texttt{iapws.iapws08._OsmoticPressure()}

• AN6-16: Relationship between Various IAPWS Documents and the International Thermodynamic Equation of Seawater - 2010 (TEOS-10)
5.1 iapws package

5.1.1 iapws._iapws module

Miscellaneous IAPWS standards. This module include:

- `Ice()`: Ice Ih state equation
- `Liquid()`: Properties of liquid water at 0.1 MPa
- `Supercooled()`: Thermodynamic properties of supercooled water
- `Sublimation_Pressure()`: Sublimation pressure correlation
- `Melting_Pressure()`: Melting pressure correlation
- `Viscosity()`: Viscosity correlation
- `ThCond()`: Thermal conductivity correlation
- `Tension()`: Surface tension correlation
- `Dielectric()`: Dielectric constant correlation
- `Refractive()`: Refractive index correlation
- `Kw()`: Ionization constant correlation for ordinary water
- `Conductivity()`: Electrolytic conductivity correlation
- `D2O_Viscosity()`: Viscosity correlation for heavy water
- `D2O_ThCond()`: Thermal conductivity correlation for heavy water
- `D2O_Tension()`: Surface tension correlation for heavy water
• _D2O_Sublimation_Pressure(): Sublimation Pressure correlation for heavy water
* _D2O_Melting_Pressure(): Melting Pressure correlation for heavy water
* _Henry(): Henry constant for liquid-gas equilibrium
* _Kvalue(): Vapor-liquid distribution constant

iapws._iapws._Ice(T, P)

Basic state equation for Ice Ih

Parameters

- T (float) – Temperature, [K]
- P (float) – Pressure, [MPa]

Returns

prop –

Dict with calculated properties of ice. The available properties are:

• rho: Density, [kg/m$^3$]
• h: Specific enthalpy, [kJ/kg]
• u: Specific internal energy, [kJ/kg]
• a: Specific Helmholtz energy, [kJ/kg]
• g: Specific Gibbs energy, [kJ/kg]
• s: Specific entropy, [kJ/kgK]
• cp: Specific isobaric heat capacity, [kJ/kgK]
• alfav: Cubic expansion coefficient, [1/K]
• beta: Pressure coefficient, [MPa/K]
• xkappa: Isothermal compressibility, [1/MPa]
• ks: Isentropic compressibility, [1/MPa]
• gt: [g/T]P
• gtt: [g^2/T^2]P
• gp: [g/P]T
• gpp: [g^2/P^2]T
• gtp: [g^2/TP]

Return type dict

Notes

Raise NotImplementedError if input isn’t in limit:

- T 273.16
- P 208.566
- State below the melting and sublimation lines
Examples

```python
>>> st1 = _Ice(100, 100)
>>> st1["rho"], st1["h"], st1["s"]
941.678203297 -483.491635676 -2.61195122589
```

```python
>>> st2 = _Ice(273.152519,0.101325)
>>> st2["a"], st2["u"], st2["cp"]
-0.00918701567 -333.465403393 2.09671391024
```

```python
>>> st3 = _Ice(273.16,611.657e-6)
>>> st3["alfav"], st3["beta"], st3["xkappa"], st3["ks"]
0.000159863102566 1.35714764659 1.17793449348e-04 1.14161597779e-04
```

References

iapws._iapws._Liquid(T, P=0.1)

Supplementary release on properties of liquid water at 0.1 MPa

Parameters

- **T** (*float*) – Temperature, [K]
- **P** (*float*) – Pressure, [MPa] Although this relation is for P=0.1MPa, can be extrapolated at pressure 0.3 MPa

Returns

- **prop** –

  Dict with calculated properties of water. The available properties are:

  - **h**: Specific enthalpy, [kJ/kg]
  - **u**: Specific internal energy, [kJ/kg]
  - **a**: Specific Helmholtz energy, [kJ/kg]
  - **g**: Specific Gibbs energy, [kJ/kg]
  - **s**: Specific entropy, [kJ/kgK]
  - **cp**: Specific isobaric heat capacity, [kJ/kgK]
  - **cv**: Specific isochoric heat capacity, [kJ/kgK]
  - **w**: Speed of sound, [m/s]
  - **rho**: Density, [kg/m³]
  - **v**: Specific volume, [m³/kg]
  - **vt**: [v/T]P, [m³/kgK]
  - **vtt**: [²v/T²]P, [m³/kgK²]
  - **vp**: [v/P]T, [m³/kg/MPa]
  - **vtp**: [²v/TP], [m³/kg/MPa]
  - **alfav**: Cubic expansion coefficient, [1/K]
- xkappa: Isothermal compressibility, [1/MPa]
- ks: Isentropic compressibility, [1/MPa]
- mu: Viscosity, [mPas]
- k: Thermal conductivity, [W/mK]
- epsilon: Dielectric constant, [-]

**Return type** dict

**Notes**

Raise `NotImplementedError` if input isn’t in limit:

- 253.15 T 383.15
- 0.1 P 0.3

**Examples**

```python
>>> stl = _Liquid(260)
>>> stl["rho"], stl["h"], stl["s"]
997.0683602710492 -55.86223174460868 -0.20998554842619535
```

### class iapws._iapws._Supercooled_minimize

**Attributes**

- x

**Methods**

<table>
<thead>
<tr>
<th>f</th>
<th>jac</th>
</tr>
</thead>
<tbody>
<tr>
<td>f(self, x)</td>
<td></td>
</tr>
<tr>
<td>jac(self, x)</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

### iapws._iapws._Supercooled(T, P)

Guideline on thermodynamic properties of supercooled water

**Parameters**

- T (`float`) – Temperature, [K]
- P (`float`) – Pressure, [MPa]
Returns

prop –
Dict with calculated properties of water. The available properties are:

- L: Ordering field, [-]
- x: Mole fraction of low-density structure, [-]
- rho: Density, [kg/m$^3$]
- s: Specific entropy, [kJ/kgK]
- h: Specific enthalpy, [kJ/kg]
- u: Specific internal energy, [kJ/kg]
- a: Specific Helmholtz energy, [kJ/kg]
- g: Specific Gibbs energy, [kJ/kg]
- alfap: Thermal expansion coefficient, [1/K]
- xkappa: Isothermal compressibility, [1/MPa]
- cp: Specific isobaric heat capacity, [kJ/kgK]
- cv: Specific isochoric heat capacity, [kJ/kgK]
- w: Speed of sound, [m/s$^2$]

Return type  dict

Notes

Raise NotImplementedException if input isn’t in limit:

- Tm $ T$ 300
- $0 < P$ 1000

The minimum temperature in range of validity is the melting temperature, it depend of pressure

Examples

```python
>>> liq = _Supercooled(235.15, 0.101325)
>>> liq["rho"], liq["cp"], liq["w"]
968.09999  5.997563  1134.5855
```

References

iapws._iapws._Sublimation_Pressure($T$)
Sublimation Pressure correlation

Parameters  $T$ (float) – Temperature, [K]

Returns  P – Pressure at sublimation line, [MPa]

Return type  float
Notes

Raise `NotImplementedError` if input isn’t in limit:

- 50 T 273.16

Examples

```python
>>> _Sublimation_Pressure(230)
8.947352740189152e-06
```

References

iapws._iapws._Sublimation_Pressure(T, ice='Ih')

Melting Pressure correlation

Parameters

- T (float) – Temperature, [K]
- ice (string) – Type of ice: Ih, III, V, VI, VII. Below 273.15 is a mandatory input, the ice Ih is the default value. Above 273.15, the ice type is unnecessary.

Returns P – Pressure at sublimation line, [MPa]

Return type float

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 251.165 T 715

Examples

```python
>>> _Melting_Pressure(260)
8.947352740189152e-06
>>> _Melting_Pressure(254, "III")
268.6846466336108
```

References

iapws._iapws._Melting_Pressure(T, ice='Ih')

Equation for the Viscosity

Parameters

- rho (float) – Density, [kg/m³]
• \(T (\text{float})\) – Temperature, [K]
• \(\text{fase} \ (\text{dict}, \text{optional for calculate critical enhancement})\) – phase properties
• \(\text{drho} \ (\text{float}, \text{optional for calculate critical enhancement})\) – \([\rho/P]T\) at reference state,

Returns \(\mu\) – Viscosity, [Pa·s]
Return type float

Examples

```python
>>> _Viscosity(998, 298.15)
0.0008897351001498108
>>> _Viscosity(600, 873.15)
7.743019522728247e-05
```

References

iapws._iapws._ThCond\((\rho, T, \text{fase=None, drho=None})\)
Equation for the thermal conductivity

Parameters

• \(\rho \ (\text{float})\) – Density, [kg/m\(^3\)]
• \(T \ (\text{float})\) – Temperature, [K]
• \(\text{fase} \ (\text{dict}, \text{optional for calculate critical enhancement})\) – phase properties
• \(\text{drho} \ (\text{float}, \text{optional for calculate critical enhancement})\) – \([\rho/P]T\) at reference state,

Returns \(k\) – Thermal conductivity, [W/mK]
Return type float

Examples

```python
>>> _ThCond(998, 298.15)
0.6077128675880629
>>> _ThCond(0, 873.15)
0.07910346589648833
```

References

iapws._iapws._Tension\((T)\)
Equation for the surface tension

5.1. iapws package
**Parameters**

\( T (float) \) – Temperature, [K]

**Returns**

\( \sigma \) – Surface tension, [N/m]

**Return type**

float

**Notes**

Raise `NotImplementedError` if input isn’t in limit:

- 248.15 \( T \) 647
- Extrapolate to -25°C in supercooled liquid metastable state

**Examples**

```python
>>> _Tension(300)
0.0716859625
>>> _Tension(450)
0.0428914992
```

**References**

**iapws._iapws._Dielectric**\((\rho, T)\)

Equation for the Dielectric constant

**Parameters**

- \( \rho (float) \) – Density, \([kg/m^3]\]
- \( T (float) \) – Temperature, [K]

**Returns**

\( \text{epsilon} \) – Dielectric constant, [-]

**Return type**

float

**Notes**

Raise `NotImplementedError` if input isn’t in limit:

- 238 \( T \) 1200

**Examples**

```python
>>> _Dielectric(999.242866, 298.15)
78.5907250
>>> _Dielectric(26.0569558, 873.15)
1.12620970
```
References

```python
iaqws._iapws._Refractive(rho, T, l=0.5893)
```
Equation for the refractive index

**Parameters**
- `rho (float)` – Density, [kg/m³]
- `T (float)` – Temperature, [K]
- `l (float, optional)` – Light Wavelength, [μm]

**Returns**
- `n` – Refractive index, [-]

**Return type**
- `float`

**Notes**

Raise `NotImplementedError` if input isn’t in limit:
- 0 \( \rho \) 1060
- 261.15 \( T \) 773.15
- 0.2 \( \lambda \) 1.1

**Examples**

```python
>>> _Refractive(997.047435, 298.15, 0.2265)
1.39277824
>>> _Refractive(30.4758534, 773.15, 0.5893)
1.00949307
```

**References**

```python
iaqws._iapws._Kw(rho, T)
```
Equation for the ionization constant of ordinary water

**Parameters**
- `rho (float)` – Density, [kg/m³]
- `T (float)` – Temperature, [K]

**Returns**
- `pKw` – Ionization constant in -log10(kw), [-]

**Return type**
- `float`
Notes

Raise `NotImplementedError` if input isn’t in limit:

- $0 \leq \rho \leq 1250$
- $273.15 \leq T \leq 1073.15$

Examples

```python
>>> _Kw(1000, 300)
13.906565
```

References

Equation for the electrolytic conductivity of liquid and dense supercritical water

Parameters

- `rho` (`float`) – Density, [kg/m$^3$]
- `T` (`float`) – Temperature, [K]

Returns `K` – Electrolytic conductivity, [S/m]

Return type `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:

- $600 \leq \rho \leq 1200$
- $273.15 \leq T \leq 1073.15$

Examples

```python
>>> _Conductivity(1000, 373.15)
1.13
```

References

IAPWS, Electrolytic Conductivity (Specific Conductance) of Liquid and Dense Supercritical Water from 0°C to 800°C and Pressures up to 1000 MPa, http://www.iapws.org/relguide/conduct.pdf

Equation for the Viscosity of heavy water

Parameters

- `rho` (`float`) – Density, [kg/m$^3$]
- `T` (`float`) – Temperature, [K]
Returns $\mu$ – Viscosity, [Pa·s]

Return type float

Examples

```python
>>> _D2O_Viscosity(998, 298.15)
0.0008897351001498108
>>> _D2O_Viscosity(600, 873.15)
7.74301952728247e-05
```

References

iapws._iapws._D2O_ThCond$(\rho, T)$

Equation for the thermal conductivity of heavy water

Parameters

- $\rho$ (float) – Density, [kg/m$^3$]
- $T$ (float) – Temperature, [K]

Returns $k$ – Thermal conductivity, [W/mK]

Return type float

Examples

```python
>>> _D2O_ThCond(998, 298.15)
0.6077128675880629
>>> _D2O_ThCond(0, 873.15)
0.07910346589648833
```

References

iapws._iapws._D2O_Tension$(T)$

Equation for the surface tension of heavy water

Parameters $T$ (float) – Temperature, [K]

Returns $\sigma$ – Surface tension, [N/m]

Return type float

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 269.65 $\leq T \leq 643.847$
Examples

```python
>>> _D2O_Tension(298.15)
0.07186
>>> _D2O_Tension(573.15)
0.01399
```

References

```
iapws._iapws._D2O_Sublimation_Pressure(T)
Sublimation Pressure correlation for heavy water

Parameters
T (float) – Temperature, [K]

Returns
P – Pressure at sublimation line, [MPa]

Return type
float
```

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 210 ≤ T ≤ 276.969

Examples

```python
>>> _Sublimation_Pressure(245)
3.27390934e-5
```

References

```
iapws._iapws._D2O_Melting_Pressure(T, ice='Ih')
Melting Pressure correlation for heavy water

Parameters

- T (float) – Temperature, [K]
- ice (string) – Type of ice: Ih, III, V, VI, VII. Below 276.969 is a mandatory input, the ice Ih is the default value. Above 276.969, the ice type is unnecessary.

Returns
P – Pressure at melting line, [MPa]

Return type
float
```

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 254.415 ≤ T ≤ 315
Examples

```python
>>> _D2O__Melting_Pressure(260)
8.947352740189152e-06
>>> _D2O__Melting_Pressure(254, "III")
268.6846466336108
```

References

```python
iapws._iapws._Henry(T, gas, liquid='H2O')
```

Equation for the calculation of Henry’s constant

**Parameters**

- `T (float)` – Temperature, [K]
- `gas (string)` – Name of gas to calculate solubility
- `liquid (string)` – Name of liquid solvent, can be H2O (default) or D2O

**Returns** `kw` – Henry’s constant, [MPa]

**Return type** `float`

**Notes**

The gas availables for H2O solvent are He, Ne, Ar, Kr, Xe, H2, N2, O2, CO, CO2, H2S, CH4, C2H6, SF6 For D2O as solvent He, Ne, Ar, Kr, Xe, D2, CH4

Raise `NotImplementedError` if input gas or liquid are unsupported

Examples

```python
>>> _Henry(500, "He")
1.1973
>>> _Henry(300, "D2", "D2O")
1.6594
```

References

```python
iapws._iapws._Kvalue(T, gas, liquid='H2O')
```

Equation for the vapor-liquid distribution constant

**Parameters**

- `T (float)` – Temperature, [K]
- `gas (string)` – Name of gas to calculate solubility
- `liquid (string)` – Name of liquid solvent, can be H2O (default) or D2O
Returns \( \text{kd} \) – Vapor-liquid distribution constant, [-]

Return type float

Notes

The gas availables for H2O solvent are He, Ne, Ar, Kr, Xe, H2, N2, O2, CO, CO2, H2S, CH4, C2H6, SF6
For D2O as solvent He, Ne, Ar, Kr, Xe, D2, CH4
Raise `NotImplementedError` if input gas or liquid are unsupported

Examples

```python
>>> _Kvalue(600, "He")
3.8019
>>> _Kvalue(300, "D2", "D2O")
14.3520
```

References

5.1.2 iapws._utils module

Miscellaneous internal utilities. This module include:

- `getphase()`: Get phase string of state
- `_fase`: Base class to define a phase state
- `deriv_H()`: Calculate generic partial derivative with a fundamental Helmholtz free energy equation of state
- `deriv_G()`: Calculate generic partial derivative with a fundamental Gibbs free energy equation of state

```python
iapws._utils.getphase(Tc, Pc, T, P, x, region)
```

Return fluid phase string name

Parameters

- \( \text{Tc} (\text{float}) \) – Critical temperature, [K]
- \( \text{Pc} (\text{float}) \) – Critical pressure, [MPa]
- \( \text{T} (\text{float}) \) – Temperature, [K]
- \( \text{P} (\text{float}) \) – Pressure, [MPa]
- \( \text{x} (\text{float}) \) – Quality, [-]
- \( \text{region} (\text{int}) \) – Region number, used only for IAPWS97 region definition

Returns phase – Phase name

Return type str

```python
class iapws._utils._fase
```

Class to implement a null phase

\texttt{iapws._utils.deriv_H(state, z, x, y, fase)}

Calculate generic partial derivative \( \frac{\partial z}{\partial x} \bigg|_y \) from a fundamental helmholtz free energy equation of state

**Parameters**

- \texttt{state (any python object)} – Only need to define P and T properties, non phase specific properties
- \texttt{z (str)} – Name of variables in numerator term of derivatives
- \texttt{x (str)} – Name of variables in denominator term of derivatives
- \texttt{y (str)} – Name of constant variable in partial derivaritive
- \texttt{fase (any python object)} – Define phase specific properties (v, cv, alfap, s, betap)

**Notes**

x, y and z can be the following values:

- P: Pressure
- T: Temperature
- v: Specific volume
- rho: Density
- u: Internal Energy
- h: Enthalpy
- s: Entropy
- g: Gibbs free energy
- a: Helmholtz free energy

**Returns** deriv – z/x/y

**Return type** float
References

iapws._utils.deriv_G(state, z, x, y, fase)
Calculate generic partial derivative $\frac{\partial z}{\partial x} |_y$ from a fundamental Gibbs free energy equation of state

Parameters

• state (any python object) – Only need to define P and T properties, non phase specific properties
• z (str) – Name of variables in numerator term of derivatives
• x (str) – Name of variables in denominator term of derivatives
• y (str) – Name of constant variable in partial derivative
• fase (any python object) – Define phase specific properties (v, cp, alfav, s, xkappa)

Notes

x, y and z can be the following values:
• P: Pressure
• T: Temperature
• v: Specific volume
• rho: Density
• u: Internal Energy
• h: Enthalpy
• s: Entropy
• g: Gibbs free energy
• a: Helmholtz free energy

Returns deriv – z/x/y
Return type float

References

5.1.3 iapws.iapws95 module

Implemented multiparameter equation of state as a Helmholtz free energy:

• MEoS: Base class of multiparameter equation of state
• IAPWS95: 2016 revision of 1995 formulation for ordinary water
• D2O: 2017 formulation for heavy water.
iapws.iapws95._phir(tau, delta, coef)
Residual contribution to the adimensional free Helmholtz energy

Parameters
- **tau** *(float)* – Inverse reduced temperature Tc/T, [-]
- **delta** *(float)* – Reduced density ρ/ρoc, [-]
- **coef** *(dict)* – Dictionary with equation of state parameters

Returns **fir** – Adimensional free Helmholtz energy

Return type **float**

References

iapws.iapws95._phird(tau, delta, coef)
Residual contribution to the adimensional free Helmholtz energy, delta derivative

Parameters
- **tau** *(float)* – Inverse reduced temperature Tc/T, [-]
- **delta** *(float)* – Reduced density ρ/ρoc, [-]
- **coef** *(dict)* – Dictionary with equation of state parameters

Returns

```
fird = \frac{\partial \phi}{\partial \delta} \Bigg|_{\tau}
```

Return type **float**

References

iapws.iapws95._phirt(tau, delta, coef)
Residual contribution to the adimensional free Helmholtz energy, tau derivative

Parameters
- **tau** *(float)* – Inverse reduced temperature Tc/T, [-]
- **delta** *(float)* – Reduced density ρ/ρoc, [-]
- **coef** *(dict)* – Dictionary with equation of state parameters

Returns

```
firt = \frac{\partial \phi}{\partial \tau} \Bigg|_{\delta}
```

References
Return type  `float`

References

```python
class iapws.iapws95.MEOS(**kwargs)
```

General implementation of multiparameter equation of state. From this derived all child class specified per individual compounds

Parameters

- `T (float)` – Temperature, [K]
- `P (float)` – Pressure, [MPa]
- `rho (float)` – Density, [kg/m$^3$]
- `v (float)` – Specific volume, [m$^3$/kg]
- `h (float)` – Specific enthalpy, [kJ/kg]
- `s (float)` – Specific entropy, [kJ/kgK]
- `u (float)` – Specific internal energy, [kJ/kg]
- `x (float)` – Vapor quality, [-]
- `l (float, optional)` – Wavelength of light, for refractive index, [nm]
- `rho0 (float, optional)` – Initial value of density, to improve iteration, [kg/m$^3$]
- `T0 (float, optional)` – Initial value of temperature, to improve iteration, [K]
- `x0` (initial value of vapor quality, necessary in bad input pair definition) – where there are two valid solution (T-h, T-s)

Notes

- It needs two incoming properties of T, P, rho, h, s, u.
- v as a alternate input parameter to rho
- T-x, P-x, preferred input pair to specified a point in two phases region

The calculated instance has the following properties:

- `P`: Pressure, [MPa]
- `T`: Temperature, [K]
- `x`: Vapor quality, [-]
- `g`: Specific Gibbs free energy, [kJ/kg]
- `a`: Specific Helmholtz free energy, [kJ/kg]
- `v`: Specific volume, [m$^3$/kg]
- `r`: Density, [kg/m$^3$]
- `h`: Specific enthalpy, [kJ/kg]
- **u**: Specific internal energy, [kJ/kg]
- **s**: Specific entropy, [kJ/kg·K]
- **cp**: Specific isobaric heat capacity, [kJ/kg·K]
- **cv**: Specific isochoric heat capacity, [kJ/kg·K]
- **cp_cv**: Heat capacity ratio, [-]
- **Z**: Compression factor, [-]
- **fi**: Fugacity coefficient, [-]
- **f**: Fugacity, [MPa]
- **gamma**: Isoentropic exponent, [-]
- **alfav**: Isobaric cubic expansion coefficient, [1/K]
- **kappa**: Isothermal compressibility, [1/MPa]
- **kappas**: Adiabatic compresibility, [1/MPa]
- **alfap**: Relative pressure coefficient, [1/K]
- **betap**: Isothermal stress coefficient, [kg/m³]
- **joule**: Joule-Thomson coefficient, [K/MPa]
- **betas**: Isoentropic temperature-pressure coefficient, [-]
- **Gruneisen**: Gruneisen parameter, [-]
- **virialB**: Second virial coefficient, [m³/kg]
- **virialC**: Third virial coefficient, [m⁶/kg²]
- **dpdT_rho**: Derivatives, dp/dT at constant rho, [MPa/K]
- **dpdrho_T**: Derivatives, dp/drho at constant T, [MPa·m³/kg]
- **drhodT_P**: Derivatives, drho/dT at constant P, [kg/m³·K]
- **drhodP_T**: Derivatives, drho/dP at constant T, [kg/m³·MPa]
- **dhdT_rho**: Derivatives, dh/dT at constant rho, [kJ/kg·K]
- **dhdP_T**: Isothermal throttling coefficient, [kJ/kg·MPa]
- **dhdT_P**: Derivatives, dh/dT at constant P, [kJ/kg·K]
- **dhdrho_T**: Derivatives, dh/drho at constant T, [kJ·m³/kg²]
- **dhdrho_P**: Derivatives, dh/drho at constant P, [kJ·m³/kg²]
- **dhdP_rhoe**: Derivatives, dh/dP at constant rho, [kJ/kg·MPa]
- **kt**: Isothermal Expansion Coefficient, [-]
- **ks**: Adiabatic Compressibility, [1/MPa]
- **Ks**: Adiabatic bulk modulus, [MPa]
- **Kt**: Isothermal bulk modulus, [MPa]
- **v0**: Ideal specific volume, [m³/kg]
- **rho0**: Ideal gas density, [kg/m³]
- **u0**: Ideal specific internal energy, [kJ/kg]
• $h_0$: Ideal specific enthalpy, [kJ/kg]
• $s_0$: Ideal specific entropy, [kJ/kg·K]
• $a_0$: Ideal specific Helmholtz free energy, [kJ/kg]
• $g_0$: Ideal specific Gibbs free energy, [kJ/kg]
• $c_p_0$: Ideal specific isobaric heat capacity, [kJ/kg·K]
• $c_v_0$: Ideal specific isochoric heat capacity, [kJ/kg·K]
• $w_0$: Ideal speed of sound, [m/s]
• $\gamma_0$: Ideal isoentropic exponent, [-]
• $w$: Speed of sound, [m/s]
• $\mu$: Dynamic viscosity, [Pa·s]
• $\nu$: Kinematic viscosity, [m$^2$/s]
• $k$: Thermal conductivity, [W/m·K]
• $\alpha$: Thermal diffusivity, [m$^2$/s]
• $\sigma$: Surface tension, [N/m]
• $\epsilon$: Dielectric constant, [-]
• $n$: Refractive index, [-]
• $\text{Prandt}$: Prandtl number, [-]
• $\text{Pr}$: Reduced Pressure, [-]
• $\text{Tr}$: Reduced Temperature, [-]
• $H_{vap}$: Vaporization heat, [kJ/kg]
• $S_{vap}$: Vaporization entropy, [kJ/kg·K]
• $Z_{\rho}$: $(Z - 1)/\rho$, [m$^3$/kg]
• $\text{IntP}$: Internal pressure, [MPa]
• $\text{invT}$: Negative reciprocal temperature, [1/K]
• $h_{\text{Input}}$: Specific heat input, [kJ/kg]

_saturation (self, T)
    Saturation calculation for two phase search

_Helmholtz (self, rho, T)
    Calculated properties from helmholtz free energy and derivatives

Parameters

• rho (float) – Density, [kg/m³]
• T (float) – Temperature, [K]

Returns

prop –

Dictionary with calculated properties:

• fir: [-]
• fird: fir/δT
• firdd: 2fir/δ²T
• delta: Reduced density \( \rho / \rho_c \), [-]
• P: Pressure, [kPa]
• h: Enthalpy, [kJ/kg]
• s: Entropy, [kJ/kgK]
• cv: Isochoric specific heat, [kJ/kgK]
• alfav: Thermal expansion coefficient, [1/K]
• betap: Isothermal compressibility, [1/kPa]

Return type  dict

References

_\text{prop}0 (self, rho, T)
Ideal gas properties

_\text{phi}0 (self, tau, delta)
Ideal gas Helmholtz free energy and derivatives

Parameters

• \textbf{tau} (float) – Inverse reduced temperature \( T_c / T \), [-]
• \textbf{delta} (float) – Reduced density \( \rho / \rho_c \), [-]

Returns \text{prop} – fio, [-] fiot: fio/\( \tau \delta \) fiod: fio/\( \delta \tau \) fiott: \( 2 \Delta \theta / \tau \delta \) fiotti: \( 2 \Delta \theta / \tau \delta \tau \) fiodd: \( 2 \Delta \theta / \delta \tau \)

Return type  dictionary with ideal adimensional helmholtz energy and deriv

References

_\text{phir} (self, tau, delta)
Residual contribution to the free Helmholtz energy

Parameters

• \textbf{tau} (float) – Inverse reduced temperature \( T_c / T \), [-]
• \textbf{delta} (float) – Reduced density \( \rho / \rho_c \), [-]

Returns

\text{prop} – 

Dictionary with residual adimensional helmholtz energy and deriv:

• fir
• firt: fir/\( \tau \delta \),x
• fird: fir/\( \delta \tau \),x
• firtt: $2\text{fir}/\tau^2\delta.x$
• firdt: $2\text{fir}/\tau\delta x$
• firdd: $2\text{fir}/\delta^2\tau.x$

**Return type** dict

IAPWS, Guideline on an Equation of State for Humid Air in Contact with Seawater and Ice, Consistent with the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, Table 7, [http://www.iapws.org/relguide/SeaAir.html](http://www.iapws.org/relguide/SeaAir.html)
_surface (self, T)

Generic equation for the surface tension

Parameters  
\( T (float) \) – Temperature, [K]

Returns  \( \sigma \) – Surface tension, [N/m]

Return type  float

Notes

Need a _surf dict in the derived class with the parameters keys:  sigma: coefficient exp: exponent

classmethod _Vapor_Pressure (T)

Auxiliary equation for the vapour pressure

Parameters  
\( T (float) \) – Temperature, [K]

Returns  \( P_v \) – Vapour pressure, [Pa]

Return type  float

References

classmethod _Liquid_Density (T)

Auxiliary equation for the density of saturated liquid

Parameters  
\( T (float) \) – Temperature, [K]

Returns  \( \rho \) – Saturated liquid density, [kg/m³]

Return type  float

References

classmethod _Vapor_Density (T)

Auxiliary equation for the density of saturated vapor

Parameters  
\( T (float) \) – Temperature, [K]

Returns  \( \rho \) – Saturated vapor density, [kg/m³]

Return type  float

References

classmethod _dPdT_sat (T)

Auxiliary equation for the dP/dT along saturation line

Parameters  
\( T (float) \) – Temperature, [K]
Returns \( rac{dP}{dT} \) – \( \frac{dP}{dT} \), [MPa/K]

Return type float

References

iapws.iapws95.

mainClassDoc()
Function decorator used to automatic adiction of base class MEoS in subclass __doc__

class iapws.iapws95. IAPWS95 (**kwargs)
Implementation of IAPWS Formulation 1995 for ordinary water substance, (revised release of 2016), for internal procedures, see MEoS base class

Parameters

• \( T (\text{float}) \) – Temperature, [K]
• \( P (\text{float}) \) – Pressure, [MPa]
• \( \rho (\text{float}) \) – Density, [kg/m\(^3\)]
• \( v (\text{float}) \) – Specific volume, [m\(^3\)/kg]
• \( h (\text{float}) \) – Specific enthalpy, [kJ/kg]
• \( s (\text{float}) \) – Specific entropy, [kJ/kgK]
• \( u (\text{float}) \) – Specific internal energy, [kJ/kg]
• \( x (\text{float}) \) – Vapor quality, [-]
• \( l (\text{float}, \text{optional}) \) – Wavelength of light, for refractive index, [nm]
• \( \rho_0 (\text{float}, \text{optional}) \) – Initial value of density, to improve iteration, [kg/m\(^3\)]
• \( T_0 (\text{float}, \text{optional}) \) – Initial value of temperature, to improve iteration, [K]
• \( \times \times \) (Initial value of vapor quality, necessary in bad input pair definition) – where there are two valid solution (T-h, T-s)

Notes

• It needs two incoming properties of \( T, P, \rho, h, s, u \).
• \( v \) as a alternate input parameter to \( \rho \)
• \( T-x, P-x \), preferred input pair to specified a point in two phases region

The calculated instance has the following properties:

• \( P \): Pressure, [MPa]
• \( T \): Temperature, [K]
• \( x \): Vapor quality, [-]
• \( g \): Specific Gibbs free energy, [kJ/kg]
• \( a \): Specific Helmholtz free energy, [kJ/kg]
• \( v \): Specific volume, [m\(^3\)/kg]
• \( r \): Density, [kg/m\(^3\)]
• \( h \): Specific enthalpy, [kJ/kg]
• \( u \): Specific internal energy, [kJ/kg]
• \( s \): Specific entropy, [kJ/kg·K]
• \( cp \): Specific isobaric heat capacity, [kJ/kg·K]
• \( cv \): Specific isochoric heat capacity, [kJ/kg·K]
• \( cp\_cv \): Heat capacity ratio, [-]
• \( Z \): Compression factor, [-]
• \( fi \): Fugacity coefficient, [-]
• \( f \): Fugacity, [MPa]
• \( gamma \): Isoentropic exponent, [-]
• \( alfav \): Isobaric cubic expansion coefficient, [1/K]
• \( kappa \): Isothermal compressibility, [1/MPa]
• \( kappas \): Adiabatic compresibility, [1/MPa]
• \( alfap \): Relative pressure coefficient, [1/K]
• \( betap \): Isothermal stress coefficient, [kg/m\(^3\)]
• \( joule \): Joule-Thomson coefficient, [K/MPa]
• \( betas \): Isoentropic temperature-pressure coefficient, [-]
• \( Gruneisen \): Gruneisen parameter, [-]
• \( virialB \): Second virial coefficient, [m\(^3\)/kg]
• \( virialC \): Third virial coefficient, [m\(^6\)/kg\(^2\)]
• \( dpdT\_rho \): Derivatives, \( dp/dT \) at constant \( \rho \), [MPa/K]
• \( dpdrho\_T \): Derivatives, \( dp/d\rho \) at constant \( T \), [MPa·m\(^3\)/kg]
• \( drhodT\_P \): Derivatives, \( drho/dT \) at constant \( P \), [kg/m\(^3\)·K]
• \( drhodP\_T \): Derivatives, \( drho/dP \) at constant \( T \), [kg/m\(^3\)·MPa]
• \( dhdT\_rho \): Derivatives, \( dh/dT \) at constant \( \rho \), [kJ/kg·K]
• \( dhdP\_T \): Isothermal throttling coefficient, [kJ/kg·MPa]
• \( dhdT\_P \): Derivatives, \( dh/dT \) at constant \( P \), [kJ/kg·K]
• \( dhdhrho\_T \): Derivatives, \( dh/d\rho \) at constant \( T \), [kJ·m\(^3\)/kg\(^2\)]
• \( dhdhrho\_P \): Derivatives, \( dh/d\rho \) at constant \( P \), [kJ·m\(^3\)/kg\(^2\)]
• \( dhdP\_rho \): Derivatives, \( dh/dP \) at constant \( \rho \), [kJ/kg·MPa]
• \( kt \): Isothermal Expansion Coefficient, [-]
• \( ks \): Adiabatic Compressibility, [1/MPa]
• \( Ks \): Adiabatic bulk modulus, [MPa]
• \( Kt \): Isothermal bulk modulus, [MPa]
• \( v0 \): Ideal specific volume, [m\(^3\)/kg]
• rho0: Ideal gas density, [kg/m$^3$]
• u0: Ideal specific internal energy, [kJ/kg]
• h0: Ideal specific enthalpy, [kJ/kg]
• s0: Ideal specific entropy, [kJ/kg-K]
• a0: Ideal specific Helmholtz free energy, [kJ/kg]
• g0: Ideal specific Gibbs free energy, [kJ/kg]
• cp0: Ideal specific isobaric heat capacity, [kJ/kg-K]
• cv0: Ideal specific isochoric heat capacity, [kJ/kg-K]
• w0: Ideal speed of sound, [m/s]
• gamma0: Ideal isoentropic exponent, [-]
• w: Speed of sound, [m/s]
• mu: Dynamic viscosity, [Pa·s]
• nu: Kinematic viscosity, [m$^2$/s]
• k: Thermal conductivity, [W/m-K]
• alfa: Thermal diffusivity, [m$^2$/s]
• sigma: Surface tension, [N/m]
• epsilon: Dielectric constant, [-]
• n: Refractive index, [-]
• Prandt: Prandtl number, [-]
• Pr: Reduced Pressure, [-]
• Tr: Reduced Temperature, [-]
• Hvap: Vaporization heat, [kJ/kg]
• Svap: Vaporization entropy, [kJ/kg-K]
• Z_rho: $(Z - 1)/\rho$, [m$^3$/kg]
• IntP: Internal pressure, [MPa]
• invT: Negative reciprocal temperature, [1/K]
• hInput: Specific heat input, [kJ/kg]

**class** `iapws.iapws95.D2O(**kwargs)`

Implementation of IAPWS Formulation for heavy water substance, for internal procedures, see MEoS base class

**Parameters**

- `T (float)` – Temperature, [K]
- `P (float)` – Pressure, [MPa]
- `rho (float)` – Density, [kg/m³]
- `v (float)` – Specific volume, [m³/kg]
- `h (float)` – Specific enthalpy, [kJ/kg]
- `s (float)` – Specific entropy, [kJ/kgK]
- `u (float)` – Specific internal energy, [kJ/kg]
- `x (float)` – Vapor quality, [-]
- `l (float, optional)` – Wavelength of light, for refractive index, [nm]
• `rho0` *(float, optional)* – Initial value of density, to improve iteration, [kg/m³]

• `T0` *(float, optional)* – Initial value of temperature, to improve iteration, [K]

• `x0` *(Initial value of vapor quality, necessary in bad input pair definition)* – where there are two valid solution (T-h, T-s)

**Notes**

• It needs two incoming properties of T, P, rho, h, s, u.

• v as a alternate input parameter to rho

• T-x, P-x, preferred input pair to specified a point in two phases region

The calculated instance has the following properties:

• P: Pressure, [MPa]

• T: Temperature, [K]

• x: Vapor quality, [-]

• g: Specific Gibbs free energy, [kJ/kg]

• a: Specific Helmholtz free energy, [kJ/kg]

• v: Specific volume, [m³/kg]

• r: Density, [kg/m³]

• h: Specific enthalpy, [kJ/kg]

• u: Specific internal energy, [kJ/kg]

• s: Specific entropy, [kJ/kg·K]

• cp: Specific isobaric heat capacity, [kJ/kg·K]

• cv: Specific isochoric heat capacity, [kJ/kg·K]

• cp_cv: Heat capacity ratio, [-]

• Z: Compression factor, [-]

• fi: Fugacity coefficient, [-]

• f: Fugacity, [MPa]

• gamma: Isoentropic exponent, [-]

• alfav: Isobaric cubic expansion coefficient, [1/K]

• kappa: Isothermal compressibility, [1/MPa]

• kappas: Adiabatic compresibility, [1/MPa]

• alfap: Relative pressure coefficient, [1/K]

• betap: Isothermal stress coefficient, [kg/m³]

• joule: Joule-Thomson coefficient, [K/MPa]

• betas: Isoentropic temperature-pressure coefficient, [-]

• Gruneisen: Gruneisen parameter, [-]

• virialB: Second virial coefficient, [m³/kg]
• virialC: Third virial coefficient, \([m^6/kg^2]\)
• dpdT_rho: Derivatives, \(dp/dT\) at constant \(rho\), \([\text{MPa/K}]\)
• dpdrho_T: Derivatives, \(dp/drho\) at constant \(T\), \([\text{MPa·m}^3/\text{kg}]\)
• drhodT_P: Derivatives, \(drho/dT\) at constant \(P\), \([\text{kg/m}^3·K]\)
• drhodP_T: Derivatives, \(drho/dP\) at constant \(T\), \([\text{kg/m}^3·\text{MPa}]\)
• dhdT_rho: Derivatives, \(dh/dT\) at constant \(rho\), \([\text{kJ/kg·K}]\)
• dhdT_P: Derivatives, \(dh/dT\) at constant \(P\), \([\text{kJ/kg·MPa}]\)
• dhdrho_T: Derivatives, \(dh/drho\) at constant \(T\), \([\text{kJ·m}^3/\text{kg}^2]\)
• dhdrho_P: Derivatives, \(dh/drho\) at constant \(P\), \([\text{kJ·m}^3/\text{kg}^2]\)
• dhdP_rho: Derivatives, \(dh/dP\) at constant \(rho\), \([\text{kJ/kg·MPa}]\)
• kt: Isothermal Expansion Coefficient, [-]
• ks: Adiabatic Compressibility, \([1/\text{MPa}]\)
• Ks: Adiabatic bulk modulus, \([\text{MPa}]\)
• Kt: Isothermal bulk modulus, \([\text{MPa}]\)
• v0: Ideal specific volume, \([\text{m}^3/\text{kg}]\)
• rho0: Ideal gas density, \([\text{kg/m}^3]\)
• u0: Ideal specific internal energy, \([\text{kJ/kg}]\)
• h0: Ideal specific enthalpy, \([\text{kJ/kg}]\)
• s0: Ideal specific entropy, \([\text{kJ/kg·K}]\)
• a0: Ideal specific Helmholtz free energy, \([\text{kJ/kg}]\)
• g0: Ideal specific Gibbs free energy, \([\text{kJ/kg}]\)
• cp0: Ideal specific isobaric heat capacity, \([\text{kJ/kg·K}]\)
• cv0: Ideal specific isochoric heat capacity, \([\text{kJ/kg·K}]\)
• w0: Ideal speed of sound, \([\text{m/s}]\)
• gamma0: Ideal isoentropic exponent, [-]
• w: Speed of sound, \([\text{m/s}]\)
• mu: Dynamic viscosity, \([\text{Pa·s}]\)
• nu: Kinematic viscosity, \([\text{m}^2/\text{s}]\)
• k: Thermal conductivity, \([\text{W/m·K}]\)
• alfa: Thermal diffusivity, \([\text{m}^2/\text{s}]\)
• sigma: Surface tension, \([\text{N/m}]\)
• epsilon: Dielectric constant, [-]
• n: Refractive index, [-]
• Prandt: Prandtl number, [-]
• Pr: Reduced Pressure, [-]
• Tr: Reduced Temperature, [-]
• Hvap: Vaporization heat, [kJ/kg]
• Svap: Vaporization entropy, [kJ/kg·K]
• \( Z_{\rho} = (Z - 1)/\rho \), [m³/kg]
• IntP: Internal pressure, [MPa]
• invT: Negative reciprocal temperature, [1/K]
• hInput: Specific heat input, [kJ/kg]

Examples

```python
>>> hwater=D2O(T=300, rho=996.5560)
>>> hwater.P, hwater.Liquid.cv, hwater.Liquid.w
0.0030675947 4.21191157 5332.04871
```

Generic equation for the surface tension

Parameters T (float) – Temperature, [K]
Returns σ – Surface tension, [N/m]
Return type float

Notes

Need a _surf dict in the derived class with the parameters keys: sigma: coefficient exp: exponent

5.1.4 iapws.iapws97 module

IAPWS-IF97 standard implementation
The module implement the fundamental equation for the five regions (rectangular boxes) and the backward equation (marked in grey).

**IAPWS97**: Global module class with all the functionality integrated

**Fundamental equations:**
- \_Region1()
- \_Region2()
- \_Region3()
- \_Region4()
- \_TSat_P()
- \_PSat_T()
- \_Region5()

**Backward equations:**
- \_Backward1_T_Ph()
- \_Backward1_T Ps()
- \_Backward1_P_hs()
- \_Backward2_T_Ph()
• _Backward2_T_Ps()
• _Backward2_P_hs()
• _Backward3_T_Ph()
• _Backward3_T_Ps()
• _Backward3_P_hs()
• _Backward3_v_Ph()
• _Backward3_v_Ps()
• _Backward3_v_PT()
• _Backward4_T_hs()

Boundary equations:
• _h13_s()
• _h3a_s()
• _h1_s()
• _t_hs()
• _PSat_h()
• _h2ab_s()
• _h_3ab()
• _h2c3b_s()
• _hab_s()
• _hbc_P()

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf

iapws.iapws97._h13_s(s)
Parameters $s$ (float) – Specific entropy, [kJ/kgK]
Returns $h$ – Specific enthalpy, [kJ/kg]
Return type float

Notes

Raise NotImplementedError if input isn’t in limit:

- $s$(100MPa,623.15K) s'$(623.15K)

References

IAPWS, Revised Supplementary Release on Backward Equations $p(h,s)$ for Region 3, Equations as a Function of $h$ and $s$ for the Region Boundaries, and an Equation $T$sat$(h,s)$ for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 7

Examples

```python
>>> _h13_s(3.7)
1632.525047
>>> _h13_s(3.5)
1566.104611
```

iapws.iapws97._P23_T($T$)

Parameters $T$ (float) – Temperature, [K]
Returns $P$ – Pressure, [MPa]
Return type float

References

Examples

```python
>>> _P23_T(623.15)
16.52916425
```

iapws.iapws97._t_P($P$)

Parameters $P$ (float) – Pressure, [MPa]
Returns $T$ – Temperature, [K]
Return type float

5.1. iapws package
References

Examples

```python
>>> _t_P(16.52916425)
623.15
```

iapws.iapws97._t_hs(h, s)

Parameters

- h (float) – Specific enthalpy, [kJ/kg]
- s (float) – Specific entropy, [kJ/kgK]

Returns

- T – Temperature, [K]

Return type

float

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 5.048096828 s 5.260578707
- 2.563592004e3 h 2.812942061e3

References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 8

Examples

```python
>>> _t_hs(2600, 5.1)
713.5259364
>>> _t_hs(2800, 5.2)
817.6202120
```

iapws.iapws97._PSat_T(T)

Parameters

- T (float) – Temperature, [K]

Returns

- P – Pressure, [MPa]

Return type

float
Notes

Raise `NotImplementedError` if input isn’t in limit:

- 273.15 ≤ T ≤ 647.096

References

Examples

```python
>>> _PSat_T(500)
2.63889776
```

`iapws.iapws97._TSat_P(P)`

Parameters

- `P` (`float`) – Pressure, [MPa]

Returns

- `T` – Temperature, [K]

Return type

- `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:

- 0.00061121 ≤ P ≤ 22.064

References

Examples

```python
>>> _TSat_P(10)
584.149488
```

`iapws.iapws97._PSat_h(h)`

Define the saturated line, \( P = f(h) \) for region 3

Parameters

- `h` (`float`) – Specific enthalpy, [kJ/kg]

Returns

- `P` – Pressure, [MPa]

Return type

- `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:

- \( h'(623.15K) \leq h \leq h''(623.15K) \)
References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions $T(p,h)$, $v(p,h)$ and $T(p,s)$, $v(p,s)$ for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 10

Examples

```python
>>> _PSat_h(1700)
17.24175718
>>> _PSat_h(2400)
20.18090839
```

iapws.iapws97._PSat_s(s)
Define the saturated line, $P=f(s)$ for region 3

Parameters

- $s$ (`float`) – Specific entropy, [kJ/kgK]

Returns

- $P$ – Pressure, [MPa]

Return type: `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:
- $s'(623.15K)$ $s$ $s''(623.15K)$

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions $T(p,h)$, $v(p,h)$ and $T(p,s)$, $v(p,s)$ for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 11

Examples

```python
>>> _PSat_s(3.8)
16.87755057
>>> _PSat_s(5.2)
16.68968482
```

iapws.iapws97._h1_s(s)

Parameters

- $s$ (`float`) – Specific entropy, [kJ/kgK]

Returns

- $h$ – Specific enthalpy, [kJ/kg]

Return type: `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:
- $s'(273.15K)$ $s$ $s'(623.15K)$
References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 3

Examples

```python
>>> _h1_s(1)
308.5509647
>>> _h1_s(3)
1198.359754
```

iapws.iapws97._h3a_s(s)

Parameters:
- `s` (float) – Specific entropy, [kJ/kgK]

Returns:
- `h` – Specific enthalpy, [kJ/kg]

Return type: float

Notes

Raise `NotImplementedError` if input isn’t in limit:

- s'(623.15K) s’ sc

References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 4

Examples

```python
>>> _h3a_s(3.8)
1685.025565
>>> _h3a_s(4.2)
1949.352563
```

iapws.iapws97._h2ab_s(s)

Define the saturated line boundary between Region 4 and 2a-2b, h=f(s)

Parameters:
- `s` (float) – Specific entropy, [kJ/kgK]

Returns:
- `h` – Specific enthalpy, [kJ/kg]

Return type: float
Notes

Raise `NotImplementedError` if input isn’t in limit:

- 5.85 ≤ s ≤ (273.15K)

References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 5

Examples

```python
>>> _h2ab_s(7)
2723.729985
>>> _h2ab_s(9)
2511.861477
```

```python
iapws.iapws97._h2c3b_s(s)
Define the saturated line boundary between Region 4 and 2c-3b, h=f(s)

Parameters

- `s (float)` – Specific entropy, [kJ/kgK]

Returns

- `h` – Specific enthalpy, [kJ/kg]

Return type

- `float`

Notes

Raise `NotImplementedError` if input isn’t in limit:

- sc ≤ 5.85

References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 6

Examples

```python
>>> _h2c3b_s(5.5)
2687.693850
>>> _h2c3b_s(4.5)
2144.360448
```

```python
iapws.iapws97._Region1(T, P)
Basic equation for region 1

Parameters

- `T` – Temperature, [K]
- `P` – Pressure, [bar]
```

iapws.iapws97._Region1(T, P)
Basic equation for region 1

Parameters

- `T` – Temperature, [K]
- `P` – Pressure, [bar]
• \( T \) (float) – Temperature, [K]
• \( P \) (float) – Pressure, [MPa]

Returns

```
prop –
```

Dict with calculated properties. The available properties are:

• \( v \): Specific volume, [m\(^3\)/kg]
• \( h \): Specific enthalpy, [kJ/kg]
• \( s \): Specific entropy, [kJ/kgK]
• \( cp \): Specific isobaric heat capacity, [kJ/kgK]
• \( cv \): Specific isocoric heat capacity, [kJ/kgK]
• \( w \): Speed of sound, [m/s]
• \( alfav \): Cubic expansion coefficient, [1/K]
• \( kt \): Isothermal compressibility, [1/MPa]

Return type  dict

References

Examples

```
>>> _Region1(300,3)['v']
0.00100215168
>>> _Region1(300,3)['h']

```

iapws.iapws97._Backward1_T_Ph\((P, h)\)

Parameters

• \( P \) (float) – Pressure, [MPa]
• \( h \) (float) – Specific enthalpy, [kJ/kg]
Returns $T$ – Temperature, [K]

Return type float

References

Examples

```python
>>> _Backward1_T_Ph(3, 500)
391.798509
>>> _Backward1_T_Ph(80, 1500)
611.041229
```

iapws.iapws97._Backward1_T_Ps($P, s$)

Parameters

- $P$ (float) – Pressure, [MPa]
- $s$ (float) – Specific entropy, [kJ/kgK]

Returns $T$ – Temperature, [K]

Return type float

References

Examples

```python
>>> _Backward1_T_Ps(3, 0.5)
307.842258
>>> _Backward1_T_Ps(80, 3)
565.899909
```

iapws.iapws97._Backward1_P_hs($h, s$)

Parameters

- $h$ (float) – Specific enthalpy, [kJ/kg]
- $s$ (float) – Specific entropy, [kJ/kgK]

Returns $P$ – Pressure, [MPa]

Return type float
References

Examples

```python
>>> _Backward1_P_hs(0.001,0)
0.0009800980612
>>> _Backward1_P_hs(90,0)
91.92954727
>>> _Backward1_P_hs(1500,3.4)
58.68294423
```

iapws.iapws97.Region2 \((T, P)\)

Basic equation for region 2

Parameters

- \(T \ (float)\) – Temperature, [K]
- \(P \ (float)\) – Pressure, [MPa]

Returns

- \(prop\) – Dict with calculated properties. The available properties are:
  - \(v\): Specific volume, [m\(^3\)/kg]
  - \(h\): Specific enthalpy, [kJ/kg]
  - \(s\): Specific entropy, [kJ/kgK]
  - \(cp\): Specific isobaric heat capacity, [kJ/kgK]
  - \(cv\): Specific isocoric heat capacity, [kJ/kgK]
  - \(w\): Speed of sound, [m/s]
  - \(alfav\): Cubic expansion coefficient, [1/K]
  - \(kt\): Isothermal compressibility, [1/MPa]

Return type: dict

iapws.iapws97.Region2_cp0(Tr,Pr)

Ideal properties for Region 2

Parameters
- Tr (float) – Reduced temperature, [-]
- Pr (float) – Reduced pressure, [-]

Returns
prop –

Array with ideal Gibbs energy partial derivatives:
- g: Ideal Specific Gibbs energy [kJ/kg]
- gp: g/T
- gpp: \( \frac{2g}{T^2} \)
- gt: g/P
- gtt: \( \frac{2g}{T^2} \)
- gpt: \( \frac{2g}{T^2} \)

Return type  array

References

iapws.iapws97._P_2bc(h)

Parameters  h (float) – Specific enthalpy, [kJ/kg]

Returns  P – Pressure, [MPa]

Return type  float

References
Examples

```python
>>> _P_2bc(3516.004323)
100.0
```

iapws.iapws97._hbc_P(P)

**Parameters**

- P (float) – Pressure, [MPa]

**Returns**

- h – Specific enthalpy, [kJ/kg]

**Return type**

float

References

Examples

```python
>>> _hbc_P(100)
3516.004323
```

iapws.iapws97._hab_s(s)

**Parameters**

- s (float) – Specific entropy, [kJ/kgK]

**Returns**

- h – Specific enthalpy, [kJ/kg]

**Return type**

float

References

Examples

```python
>>> _hab_s(7)
3376.437884
```

iapws.iapws97._Backward2a_T_Ph(P, h)

**Parameters**

- P (float) – Pressure, [MPa]
- h (float) – Specific enthalpy, [kJ/kg]

**Returns**

- T – Temperature, [K]

**Return type**

float
References

Examples

```python
>>> _Backward2a_T_Ph(0.001,3000)
534.433241
>>> _Backward2a_T_Ph(3,4000)
1010.77577
```

iapws.iapws97._Backward2b_T_Ph(P, h)

Parameters

- `P (float)` – Pressure, [MPa]
- `h (float)` – Specific enthalpy, [kJ/kg]

Returns `T` – Temperature, [K]

Return type `float`

References

Examples

```python
>>> _Backward2b_T_Ph(5,4000)
1015.31583
>>> _Backward2b_T_Ph(25,3500)
875.279054
```

iapws.iapws97._Backward2c_T_Ph(P, h)

Parameters

- `P (float)` – Pressure, [MPa]
- `h (float)` – Specific enthalpy, [kJ/kg]

Returns `T` – Temperature, [K]

Return type `float`

References

Examples

```python
>>> _Backward2c_T_Ph(40, 2700)
743.056411
>>> _Backward2c_T_Ph(60, 3200)
882.756860
```

\texttt{iapws.iapws97.\_Backward2c\_T\_Ph}(\texttt{P}, \texttt{h})

**Parameters**
- \texttt{P} (\texttt{float}) – Pressure, [MPa]
- \texttt{h} (\texttt{float}) – Specific enthalpy, [kJ/kg]

**Returns** \texttt{T} – Temperature, [K]

**Return type** \texttt{float}

\texttt{iapws.iapws97.\_Backward2a\_T\_Ps}(\texttt{P}, \texttt{s})

**Parameters**
- \texttt{P} (\texttt{float}) – Pressure, [MPa]
- \texttt{s} (\texttt{float}) – Specific entropy, [kJ/kgK]

**Returns** \texttt{T} – Temperature, [K]

**Return type** \texttt{float}

References

Examples

```python
>>> _Backward2a_T_Ps(0.1, 7.5)
399.517097
>>> _Backward2a_T_Ps(2.5, 8)
1039.84917
```

\texttt{iapws.iapws97.\_Backward2b\_T\_Ps}(\texttt{P}, \texttt{s})

**Parameters**
- \texttt{P} (\texttt{float}) – Pressure, [MPa]
- \texttt{s} (\texttt{float}) – Specific entropy, [kJ/kgK]

**Returns** \texttt{T} – Temperature, [K]

**Return type** \texttt{float}

References

Examples

```python
>>> _Backward2b_T_Ps(8, 6)
600.484040
>>> _Backward2b_T_Ps(90, 6)
1038.01126
```

iapws.iapws97._Backward2c_T_Ps(P, s)

Parameters

- \( P (\text{float}) \) – Pressure, [MPa]
- \( s (\text{float}) \) – Specific entropy, [kJ/kgK]

Returns \( T \) – Temperature, [K]

Return type \( \text{float} \)

References

Examples

```python
>>> _Backward2c_T_Ps(20, 5.75)
697.992849
>>> _Backward2c_T_Ps(80, 5.75)
949.017998
```

iapws.iapws97._Backward2_T_Ps(P, s)

Parameters

- \( P (\text{float}) \) – Pressure, [MPa]
- \( s (\text{float}) \) – Specific entropy, [kJ/kgK]

Returns \( T \) – Temperature, [K]

Return type \( \text{float} \)

iapws.iapws97._Backward2a_P_hs(h, s)

Parameters

- \( h (\text{float}) \) – Specific enthalpy, [kJ/kg]
- \( s (\text{float}) \) – Specific entropy, [kJ/kgK]

Returns \( P \) – Pressure, [MPa]

Return type \( \text{float} \)

References

Examples

>>> _Backward2a_P_hs(2800, 6.5)
1.371012767
>>> _Backward2a_P_hs(2800, 9.5)
0.001879743844
>>> _Backward2a_P_hs(4100, 9.5)
0.1024788997

iapws.iapws97._Backward2b_P_hs(h, s)

Parameters

- h (float) – Specific enthalpy, [kJ/kg]
- s (float) – Specific entropy, [kJ/kgK]

Returns P – Pressure, [MPa]

Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for Pressure as a Function of Enthalpy and Entropy p(h,s) for Regions 1 and 2 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-PHS12-2014.pdf, Eq 4

Examples

>>> _Backward2b_P_hs(2800, 6)
4.793911442
>>> _Backward2b_P_hs(3600, 6)

>>> _Backward2b_P_hs(3600, 7)
7.527161441

iapws.iapws97._Backward2c_P_hs(h, s)

Parameters

- h (float) – Specific enthalpy, [kJ/kg]
- s (float) – Specific entropy, [kJ/kgK]

Returns P – Pressure, [MPa]

Return type float

References

Examples

```python
>>> _Backward2c_P_hs(2800, 5.1)
94.39202060
>>> _Backward2c_P_hs(2800, 5.8)
8.41574124
>>> _Backward2c_P_hs(3400, 5.8)
83.76903879
```

iapws.iapws97._Backward2c_P_hs(h, s)

Parameters

- h (float) – Specific enthalpy, [kJ/kg]
- s (float) – Specific entropy, [kJ/kgK]

Returns

- P – Pressure, [MPa]

Return type

float

iapws.iapws97._Region3(rho, T)

Basic equation for region 3

Parameters

- rho (float) – Density, [kg/m$^3$]
- T (float) – Temperature, [K]

Returns

- prop –

Dict with calculated properties. The available properties are:

- v: Specific volume, [m$^3$/kg]
- h: Specific enthalpy, [kJ/kg]
- s: Specific entropy, [kJ/kgK]
- cp: Specific isobaric heat capacity, [kJ/kgK]
- cv: Specific isocoric heat capacity, [kJ/kgK]
- w: Speed of sound, [m/s]
- alfav: Cubic expansion coefficient, [1/K]
- kt: Isothermal compressibility, [1/MPa]

Return type

dict

References

Examples
iapws.iapws97._h_3ab \( (P) \)
Define the boundary between Region 3a-3b, \( h=f(P) \)

**Parameters**

- **\( P \)** ([float]) – Pressure, [MPa]
- **\( h \)** – Specific enthalpy, [kJ/kg]

**Return type**

- float

**Examples**

```python
>>> _h_3ab(25)
2095.936454
```

iapws.iapws97._tab_P \( (P) \)
Define the boundary between Region 3a-3b, \( T=f(P) \)

**Parameters**

- **\( P \)** ([float]) – Pressure, [MPa]
- **\( T \)** – Temperature, [K]

**Return type**

- float

**References**

**Examples**

```python
>>> _tab_P(40)
693.0341408
```

iapws.iapws97._top_P \( (P) \)
Define the boundary between Region 3o-3p, \( T=f(P) \)
Parameters \( P \) (float) – Pressure, [MPa]

Returns \( T \) – Temperature, [K]

Return type float

References

Examples

```python
>>> _top_P(22.8)
650.0106943
```

iapws.iapws97._twx_P(P)

Define the boundary between Region 3w-3x, \( T=f(P) \)

Parameters \( P \) (float) – Pressure, [MPa]

Returns \( T \) – Temperature, [K]

Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for Specific Volume as a Function of Pressure and Temperature \( v(p,T) \) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-VPT3-2016.pdf, Eq. 2

Examples

```python
>>> _twx_P(22.3)
648.2049480
```

iapws.iapws97._tef_P(P)

Define the boundary between Region 3e-3f, \( T=f(P) \)

Parameters \( P \) (float) – Pressure, [MPa]

Returns \( T \) – Temperature, [K]

Return type float

References

Examples

```python
>>> _tef_P(40)
713.9593992
```

iapws.iapws97._txx_P(P, xy)

Define the boundary between 3x-3y, T=f(P)

Parameters

- **P** *(float)* – Pressure, [MPa]
- **xy** *(string)* – Subregions options: cd, gh, ij, jk, mn, qu, rx, uv

Returns **T** – Temperature, [K]

Return type **float**

References

Examples

```python
>>> _txx_P(25, "cd")
649.3659208
>>> _txx_P(23, "gh")
649.8873759
>>> _txx_P(23, "ij")
651.5778091
>>> _txx_P(23, "jk")
655.8338344
>>> _txx_P(22.8, "mn")
649.6054133
>>> _txx_P(22, "qu")
645.6355027
>>> _txx_P(22, "rx")
648.2622754
>>> _txx_P(22.3, "uv")
647.7996121
```

iapws.iapws97._Backward3a_v_Ph(P, h)

Parameters

- **P** *(float)* – Pressure, [MPa]
- **h** *(float)* – Specific enthalpy, [kJ/kg]

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions T(p,h), v(p,h) and T(p,s), v(p,s) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 4
iapws Documentation, Release 1.5.2

Returns \(v\) – Specific volume, \([m^3/kg]\)
Return type float

Examples

```python
>>> _Backward3a_v_Ph(20,1700)
0.001749903962
>>> _Backward3a_v_Ph(100,2100)
0.001676229776
```

iapws.iapws97._Backward3b_v_Ph\((P, h)\)

Parameters

- \(P\) (float) – Pressure, [MPa]
- \(h\) (float) – Specific enthalpy, [kJ/kg]

Returns \(v\) – Specific volume, \([m^3/kg]\)
Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions \(T(p,h)\), \(v(p,h)\) and \(T(p,s)\), \(v(p,s)\) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%29-2014.pdf, Eq 5

Examples

```python
>>> _Backward3b_v_Ph(20,2500)
0.006670547043
>>> _Backward3b_v_Ph(100,2700)
0.002404234998
```

iapws.iapws97._Backward3_v_Ph\((P, h)\)

Parameters

- \(P\) (float) – Pressure, [MPa]
- \(h\) (float) – Specific enthalpy, [kJ/kg]

Returns \(v\) – Specific volume, \([m^3/kg]\)
Return type float

iapws.iapws97._Backward3a_T_Ph\((P, h)\)

Parameters

- \(P\) (float) – Pressure, [MPa]
- \(h\) (float) – Specific enthalpy, [kJ/kg]

Returns \(T\) – Temperature, [K]
Return type float
References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions $T(p,h)$, $v(p,h)$ and $T(p,s)$, $v(p,s)$ for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 2

Examples

```python
>>> _Backward3a_T_Ph(20,1700)
629.3083892
>>> _Backward3a_T_Ph(100,2100)
733.6163014
```

iapws.iapws97._Backward3b_T_Ph($P$, $h$)

Parameters

- $P$ (float) – Pressure, [MPa]
- $h$ (float) – Specific enthalpy, [kJ/kg]

Returns $T$ – Temperature, [K]

Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions $T(p,h)$, $v(p,h)$ and $T(p,s)$, $v(p,s)$ for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 3

Examples

```python
>>> _Backward3b_T_Ph(20,2500)
641.8418053
>>> _Backward3b_T_Ph(100,2700)
842.0460876
```

iapws.iapws97._Backward3_T_Ph($P$, $h$)

Parameters

- $P$ (float) – Pressure, [MPa]
- $h$ (float) – Specific enthalpy, [kJ/kg]

Returns $T$ – Temperature, [K]

Return type float

iapws.iapws97._Backward3a_v_Ps($P$, $s$)

Parameters

- $P$ (float) – Pressure, [MPa]
- $s$ (float) – Specific entropy, [kJ/kgK]

Returns $v$ – Specific volume, [m$^3$/kg]
Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions T(p,h), v(p,h) and T(p,s), v(p,s) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 8

Examples

```python
>>> _Backward3a_v_Ps(20,3.8)
0.001733791463
>>> _Backward3a_v_Ps(100,4)
0.001555893131
```

iapws.iapws97._Backward3b_v_Ps(P,s)

Parameters

• \( P (float) \) – Pressure, [MPa]
• \( s (float) \) – Specific entropy, [kJ/kgK]

Returns \( V \) – Specific volume, [m\(^3\)/kg]

Return type float

References

IAPWS, Revised Supplementary Release on Backward Equations for the Functions T(p,h), v(p,h) and T(p,s), v(p,s) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 9

Examples

```python
>>> _Backward3b_v_Ps(20,5)
0.006262101987
>>> _Backward3b_v_Ps(100,5)
0.002449610757
```

iapws.iapws97._Backward3_v_Ps(P,s)

Parameters

• \( P (float) \) – Pressure, [MPa]
• \( s (float) \) – Specific entropy, [kJ/kgK]

Returns \( V \) – Specific volume, [m\(^3\)/kg]

Return type float

iapws.iapws97._Backward3a_T_Ps(P,s)

Parameters

• \( P (float) \) – Pressure, [MPa]
• **s (float)** – Specific entropy, [kJ/kgK]

  **Returns**  \( T \) – Temperature, [K]

  **Return type**  float

**References**

**Examples**

```python
>>> _Backward3a_T_Ps(20,3.8)
628.2959869
>>> _Backward3a_T_Ps(100,4)
705.6880237
```

**iapws.iapws97.\_Backward3b_T_Ps (P,s)**

**Parameters**

• **P (float)** – Pressure, [MPa]

• **s (float)** – Specific entropy, [kJ/kgK]

  **Returns**  \( T \) – Temperature, [K]

  **Return type**  float

**References**

IAPWS, Revised Supplementary Release on Backward Equations for the Functions \( T(p,h) \), \( v(p,h) \) and \( T(p,s) \), \( v(p,s) \) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-Tv%28ph,ps%293-2014.pdf, Eq 7

**Examples**

```python
>>> _Backward3b_T_Ps(20,5)
640.1176443
>>> _Backward3b_T_Ps(100,5)
847.4332825
```

**iapws.iapws97.\_Backward3_T_Ps (P,s)**

**Parameters**

• **P (float)** – Pressure, [MPa]

• **s (float)** – Specific entropy, [kJ/kgK]

  **Returns**  \( T \) – Temperature, [K]

  **Return type**  float

**5.1. iapws package**
Parameters

- \( h (float) \) – Specific enthalpy, [kJ/kg]
- \( s (float) \) – Specific entropy, [kJ/kgK]

Returns \( P \) – Pressure, [MPa]

Return type \( float \)

References

IAPWS, Revised Supplementary Release on Backward Equations \( p(h,s) \) for Region 3, Equations as a Function of \( h \) and \( s \) for the Region Boundaries, and an Equation \( T_{sat}(h,s) \) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \url{http://www.iapws.org/relguide/Supp-phs3-2014.pdf}. Eq 1

Examples

```python
>>> _Backward3a_P_hs(1700, 3.8)
25.55703246
>>> _Backward3a_P_hs(2000, 4.2)
45.40873468
>>> _Backward3a_P_hs(2100, 4.3)
60.78123340
```

iapws.iapws97._Backward3b_P_hs(\( h, s \))

Parameters

- \( h (float) \) – Specific enthalpy, [kJ/kg]
- \( s (float) \) – Specific entropy, [kJ/kgK]

Returns \( P \) – Pressure, [MPa]

Return type \( float \)

References

IAPWS, Revised Supplementary Release on Backward Equations \( p(h,s) \) for Region 3, Equations as a Function of \( h \) and \( s \) for the Region Boundaries, and an Equation \( T_{sat}(h,s) \) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \url{http://www.iapws.org/relguide/Supp-phs3-2014.pdf}. Eq 1

Examples

```python
>>> _Backward3b_P_hs(2400, 4.7)
63.63924887
>>> _Backward3b_P_hs(2600, 5.1)
34.34999263
>>> _Backward3b_P_hs(2700, 5.0)
88.39043281
```

iapws.iapws97._Backward3_P_hs(\( h, s \))

Parameters
• \( h (\text{float}) \) – Specific enthalpy, [kJ/kg]
• \( s (\text{float}) \) – Specific entropy, [kJ/kgK]

Returns \( P \) – Pressure, [MPa]
Return type float

\[
\text{iapws.iapws97.\_Backward3\_sat\_v\_P}(P, x)
\]

Parameters
• \( T (\text{float}) \) – Temperature, [K]
• \( P (\text{float}) \) – Pressure, [MPa]
• \( x (\text{integer}) \) – Vapor quality, [-]

Returns \( v \) – Specific volume, [m\(^3\)/kg]
Return type float

Notes
The vapor quality \( x \) can be 0 (saturated liquid) or 1 (saturated vapour)

\[
\text{iapws.iapws97.\_Backward3\_v\_PT}(P, T)
\]

Parameters
• \( T (\text{float}) \) – Temperature, [K]
• \( P (\text{float}) \) – Pressure, [MPa]

Returns \( v \) – Specific volume, [m\(^3\)/kg]
Return type float

References
IAPWS, Revised Supplementary Release on Backward Equations for Specific Volume as a Function of Pressure and Temperature \( v(p, T) \) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-VPT3-2016.pdf, Table 2 and 10

\[
\text{iapws.iapws97.\_Backward3x\_v\_PT}(P, T, x)
\]

Parameters
• \( T (\text{float}) \) – Temperature, [K]
• \( P (\text{float}) \) – Pressure, [MPa]
• \( x (\text{char}) \) – Region 3 subregion code

Returns \( v \) – Specific volume, [m\(^3\)/kg]
Return type float

References

(continues on next page)
iapws.iapws97._Region4 (P, x)

Basic equation for region 4

Parameters

- \( P \) (float) – Pressure, [MPa]
- \( x \) (float) – Vapor quality, [-]

5.1. iapws package
Returns

prop –
Dict with calculated properties. The available properties are:

• T: Saturated temperature, [K]
• P: Saturated pressure, [MPa]
• x: Vapor quality, [-]
• v: Specific volume, [m$^3$/kg]
• h: Specific enthalpy, [kJ/kg]
• s: Specific entropy, [kJ/kgK]

Return type  dict

iapws.iapws97._Backward4_T_hs(h, s)

Parameters

• h (float) – Specific enthalpy, [kJ/kg]
• s (float) – Specific entropy, [kJ/kgK]

Returns  T – Temperature, [K]

Return type  float

References

IAPWS, Revised Supplementary Release on Backward Equations p(h,s) for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation Tsat(h,s) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, http://www.iapws.org/relguide/Supp-phs3-2014.pdf. Eq 9

Examples

```
>>> _Backward4_T_hs(1800,5.3)
346.8475498
>>> _Backward4_T_hs(2400,6.0)
425.1373305
>>> _Backward4_T_hs(2500,5.5)
522.5579013
```

iapws.iapws97._Region5(T, P)

Basic equation for region 5

Parameters

• T (float) – Temperature, [K]
• P (float) – Pressure, [MPa]

Returns

prop –
Dict with calculated properties. The available properties are:

• v: Specific volume, [m$^3$/kg]
• h: Specific enthalpy, [kJ/kg]
• s: Specific entropy, [kJ/kgK]
• cp: Specific isobaric heat capacity, [kJ/kgK]
• cv: Specific isocoric heat capacity, [kJ/kgK]
• w: Speed of sound, [m/s]
• alfav: Cubic expansion coefficient, [1/K]
• kt: Isothermal compressibility, [1/MPa]

Return type  dict

References

Examples

```python

0.0329193892
```

iapws.iapws97.Region5_cp0(Tr, Pr)
Ideal properties for Region 5

Parameters

• Tr (float) – Reduced temperature, [-]
• Pr (float) – Reduced pressure, [-]

Returns

prop –

Array with ideal Gibbs energy partial derivatives:

• g: Ideal Specific Gibbs energy, [kJ/kg]
• gp: [g/P]T
• gpp: [2g/P^2]T

5.1. iapws package
• gt: \([g/T]P\)
• gtt: \([g^2/T^2]P\)
• gpt: \([g^2/TP]\)

Return type  array

References

iapws.iapws97._Bound_TP(T, P)
Region definition for input T and P

Parameters

• T \((float)\) – Temperature, [K]
• P \((float)\) – Pressure, [MPa]

Returns  region – IAPWS-97 region code

Return type  float

References

Wagner, W; Kretzschmar, H-J: International Steam Tables: Properties of Water and Steam Based on the Industrial Formulation IAPWS-IF97; Springer, 2008; doi: 10.1007/978-3-540-74234-0. Fig. 2.3

iapws.iapws97._Bound_Ph(P, h)
Region definition for input P y h

Parameters

• P \((float)\) – Pressure, [MPa]
• h \((float)\) – Specific enthalpy, [kJ/kg]

Returns  region – IAPWS-97 region code

Return type  float

References

Wagner, W; Kretzschmar, H-J: International Steam Tables: Properties of Water and Steam Based on the Industrial Formulation IAPWS-IF97; Springer, 2008; doi: 10.1007/978-3-540-74234-0. Fig. 2.5

iapws.iapws97._Bound_Ps(P, s)
Region definition for input P and s

Parameters

• P \((float)\) – Pressure, [MPa]
• s \((float)\) – Specific entropy, [kJ/kgK]

Returns  region – IAPWS-97 region code

Return type  float
iapws Documentation, Release 1.5.2

References

Wagner, W; Kretzschmar, H-J: International Steam Tables: Properties of Water and Steam Based on the Industrial Formulation IAPWS-IF97; Springer, 2008; doi: 10.1007/978-3-540-74234-0. Fig. 2.9

iapws.iapws97._Bound_hs(h, s)
Region definition for input h and s

Parameters

• h (float) – Specific enthalpy, [kJ/kg]
• s (float) – Specific entropy, [kJ/kgK]

Returns region – IAPWS-97 region code

Return type float

References

Wagner, W; Kretzschmar, H-J: International Steam Tables: Properties of Water and Steam Based on the Industrial Formulation IAPWS-IF97; Springer, 2008; doi: 10.1007/978-3-540-74234-0. Fig. 2.14

iapws.iapws97.prop0(T, P)
Ideal gas properties

Parameters

• T (float) – Temperature, [K]
• P (float) – Pressure, [MPa]

Returns

prop –
Dict with calculated properties. The available properties are:
• v: Specific volume, [m^3/kg]
• h: Specific enthalpy, [kJ/kg]
• s: Specific entropy, [kJ/kgK]
• cp: Specific isobaric heat capacity, [kJ/kgK]
• cv: Specific isochoric heat capacity, [kJ/kgK]
• w: Speed of sound, [m/s]
• alfav: Cubic expansion coefficient, [1/K]
• kt: Isothermal compressibility, [1/MPa]

Return type dict

class iapws.iapws97.IAPWS97(**kwargs)
Class to model a state of liquid water or steam with the IAPWS-IF97

Parameters

• T (float) – Temperature, [K]
• P (float) – Pressure, [MPa]
• h (float) – Specific enthalpy, [kJ/kg]
- `s (float)` – Specific entropy, [kJ/kgK]
- `x (float)` – Vapor quality, [-]
- `l (float, optional)` – Wavelength of light, for refractive index, [nm]

**Notes**

Definitions options:
- `T, P`: Not valid for two-phases region
- `P, h`
- `P, s`
- `h, s`
- `T, x`: Only for two-phases region
- `P, x`: Only for two-phases region

**Returns**

`prop` –
The calculated instance has the following properties:
- `P`: Pressure, [MPa]
- `T`: Temperature, [K]
- `g`: Specific Gibbs free energy, [kJ/kg]
- `a`: Specific Helmholtz free energy, [kJ/kg]
- `v`: Specific volume, [m³/kg]
- `rho`: Density, [kg/m³]
- `h`: Specific enthalpy, [kJ/kg]
- `u`: Specific internal energy, [kJ/kg]
- `s`: Specific entropy, [kJ/kg·K]
- `cp`: Specific isobaric heat capacity, [kJ/kg·K]
- `cv`: Specific isochoric heat capacity, [kJ/kg·K]
- `Z`: Compression factor, [-]
- `fi`: Fugacity coefficient, [-]
- `f`: Fugacity, [MPa]
- `gamma`: Isoentropic exponent, [-]
- `alfav`: Isobaric cubic expansion coefficient, [1/K]
- `xkappa`: Isothermal compressibility, [1/MPa]
- `kappas`: Adiabatic compresibility, [1/MPa]
- `alfap`: Relative pressure coefficient, [1/K]
- `betap`: Isothermal stress coefficient, [kg/m³]
- `joule`: Joule-Thomson coefficient, [K/MPa]
• deltat: Isothermal throttling coefficient, [kJ/kg·MPa]
• region: Region
• v0: Ideal specific volume, [m³/kg]
• u0: Ideal specific internal energy, [kJ/kg]
• h0: Ideal specific enthalpy, [kJ/kg]
• s0: Ideal specific entropy, [kJ/kg·K]
• a0: Ideal specific Helmholtz free energy, [kJ/kg]
• g0: Ideal specific Gibbs free energy, [kJ/kg]
• cp0: Ideal specific isobaric heat capacity, [kJ/kg·K]
• cv0: Ideal specific isochoric heat capacity [kJ/kg·K]
• w0: Ideal speed of sound, [m/s]
• gamma0: Ideal isoentropic exponent, [-]
• w: Speed of sound, [m/s]
• mu: Dynamic viscosity, [Pa·s]
• nu: Kinematic viscosity, [m²/s]
• k: Thermal conductivity, [W/m·K]
• alfa: Thermal diffusivity, [m²/s]
• sigma: Surface tension, [N/m]
• epsilon: Dielectric constant, [-]
• n: Refractive index, [-]
• Prandt: Prandtl number, [-]
• Pr: Reduced Pressure, [-]
• Tr: Reduced Temperature, [-]
• Hvap: Vaporization heat, [kJ/kg]
• S vap: Vaporization entropy, [kJ/kg·K]

Return type  dict

Examples

```python

```python
class iapws.iapws97.IAPWS97(**kwargs)
class to model a state of liquid water or steam with the IAPWS-IF97

Parameters

- T (float) – Temperature, [K]
- P (float) – Pressure, [MPa]
- h (float) – Specific enthalpy, [kJ/kg]
- s (float) – Specific entropy, [kJ/kgK]
- x (float) – Vapor quality, [-]
- l (float, optional) – Wavelength of light, for refractive index, [nm]

Notes

Definitions options:

- T, P: Not valid for two-phases region
- P, h
- P, s
- h, s
- T, x: Only for two-phases region
- P, x: Only for two-phases region

Returns

prop –

The calculated instance has the following properties:

- P: Pressure, [MPa]
- T: Temperature, [K]
- g: Specific Gibbs free energy, [kJ/kg]
- a: Specific Helmholtz free energy, [kJ/kg]
- v: Specific volume, [m^3/kg]
- rho: Density, [kg/m^3]
- h: Specific enthalpy, [kJ/kg]
• u: Specific internal energy, [kJ/kg]
• s: Specific entropy, [kJ/kg·K]
• cp: Specific isobaric heat capacity, [kJ/kg·K]
• cv: Specific isochoric heat capacity, [kJ/kg·K]
• Z: Compression factor, [-]
• fi: Fugacity coefficient, [-]
• f: Fugacity, [MPa]
• gamma: Isoentropic exponent, [-]
• alfav: Isobaric cubic expansion coefficient, [1/K]
• xkappa: Isothermal compressibility, [1/MPa]
• kappas: Adiabatic compressibility, [1/MPa]
• alfap: Relative pressure coefficient, [1/K]
• betap: Isothermal stress coefficient, [kg/m³]
• joule: Joule-Thomson coefficient, [K/MPa]
• deltat: Isothermal throttling coefficient, [kJ/kg·MPa]
• region: Region
• v0: Ideal specific volume, [m³/kg]
• u0: Ideal specific internal energy, [kJ/kg]
• h0: Ideal specific enthalpy, [kJ/kg]
• s0: Ideal specific entropy, [kJ/kg·K]
• a0: Ideal specific Helmholtz free energy, [kJ/kg]
• g0: Ideal specific Gibbs free energy, [kJ/kg]
• cp0: Ideal specific isobaric heat capacity, [kJ/kg·K]
• cv0: Ideal specific isochoric heat capacity [kJ/kg·K]
• w0: Ideal speed of sound, [m/s]
• gamma0: Ideal isoentropic exponent, [-]
• w: Speed of sound, [m/s]
• mu: Dynamic viscosity, [Pa·s]
• nu: Kinematic viscosity, [m²/s]
• k: Thermal conductivity, [W/m·K]
• alfa: Thermal diffusivity, [m²/s]
• sigma: Surface tension, [N/m]
• epsilon: Dielectric constant, [-]
• n: Refractive index, [-]
• Prandt: Prandtl number, [-]
• Pr: Reduced Pressure, [-]
• Tr: Reduced Temperature, [-]
• Hvap: Vaporization heat, [kJ/kg]
• Svap: Vaporization entropy, [kJ/kg·K]

Return type: dict

Examples

```python
>>> water=IAPWS97(T=170+273.15, x=0.5)
>>> water.Liquid.cp, water.Vapor.cp, water.Liquid.w, water.Vapor.w
4.3695 2.5985 1418.3 498.78

>>> water=IAPWS97(T=325+273.15, x=0.5)
>>> water.P, water.Liquid.v, water.Vapor.v, water.Liquid.h, water.Vapor.h
12.0505 0.00152830 0.0141887 1493.37 2684.48

>>> water=IAPWS97(T=50+273.15, P=0.0006112127)
>>> water.cp0, water.cv0, water.h0, water.s0, water.w0
1.8714 1.4098 2594.66 9.471 444.93
```

Methods

```python
derivative(self, z, x, y, fase) Wrapper derivative for custom derived properties where x, y, z can be: P, T, v, u, h, s, g, a
```

5.1.5 iapws.iapws08 module

IAPWS standard for Seawater IAPWS08 and related functionality. The module include:

**SeaWater**: Global module class with all the functionality integrated

Other functionality:

• `_Tb()`: Boiling temperature of seawater
• `_Tf()`: Freezing temperature of seawater
• `_Triple()`: Triple point properties of seawater
• `_OsmoticPressure()`: Osmotic pressure of seawater
• `_ThCond_SeaWater()`: Thermal conductivity of seawater
• `_Tension_SeaWater()`: Surface tension of seawater
• `_solNa2SO4()`: Solubility of sodium sulfate in aqueous mixtures of sodium chloride and sulfuric acid
• `_critNaCl()`: Critical locus of aqueous solutions of sodium chloride

```python
class iapws.iapws08.SeaWater(**kwargs)
```
Parameters

- **T (float)** – Temperature, [K]
- **P (float)** – Pressure, [MPa]
- **S (float)** – Salinity, [kg/kg]
- **fast (bool, default False)** – Use the Supplementary release SR7-09 to speed up the calculation
- **IF97 (bool, default False)** – Use the Advisory Note No. 5 with industrial formulation

Returns

- **rho (float)** – Density, [kg/m$^3$]
- **v (float)** – Specific volume, [m$^3$/kg]
- **h (float)** – Specific enthalpy, [kJ/kg]
- **s (float)** – Specific entropy, [kJ/kg·K]
- **u (float)** – Specific internal energy, [kJ/kg]
- **g (float)** – Specific Gibbs free energy, [kJ/kg]
- **a (float)** – Specific Helmholtz free energy, [kJ/kg]
- **cp (float)** – Specific isobaric heat capacity, [kJ/kg·K]
- **cv (float)** – Specific isochoric heat capacity, [kJ/kg·K]
- **gt (float)** – Derivative Gibbs energy with temperature, [kJ/kg·K]
- **gp (float)** – Derivative Gibbs energy with pressure, [m$^3$/kg]
- **gtt (float)** – Derivative Gibbs energy with temperature square, [kJ/kg·K$^2$]
- **gtp (float)** – Derivative Gibbs energy with pressure and temperature, [m$^3$/kg·K]
- **gpp (float)** – Derivative Gibbs energy with temperature square, [m$^3$/kg·MPa]
- **gs (float)** – Derivative Gibbs energy with salinity, [kJ/kg]
- **gsp (float)** – Derivative Gibbs energy with salinity and pressure, [m$^3$/kg]
- **alfav (float)** – Thermal expansion coefficient, [1/K]
- **betas (float)** – Isentropic temperature-pressure coefficient, [K/MPa]
- **xkappa (float)** – Isothermal compressibility, [1/MPa]
- **ks (float)** – Isentropic compressibility, [1/MPa]
- **w (float)** – Sound Speed, [m/s]
- **k (float)** – Thermal conductivity, [W/m·K]
- **sigma (float)** – Surface tension, [N/m]
- **m (float)** – Molality of seawater, [mol/kg]
- **mu (float)** – Relative chemical potential, [kJ/kg]
- **muw (float)** – Chemical potential of H2O, [kJ/kg]
- **mus (float)** – Chemical potential of sea salt, [kJ/kg]
- **osm (float)** – Osmotic coefficient, [-]
• **haline** *(float)* – Haline contraction coefficient, [kg/kg]

**Notes**

**Warning** if input isn’t in limit:

- 261 ≤ T ≤ 353
- 0 < P < 100
- 0 ≤ S ≤ 0.12

    iapws.iapws08._Triple(S)
Procedure to calculate the triple point pressure and temperature for seawater
    Parameters S (float) – Salinity, [kg/kg]
    Returns
        prop –
        Dictionary with the triple point properties:
```

5.1. iapws package
• \( T_t \): Triple point temperature, [K]
• \( P_t \): Triple point pressure, [MPa]

**Return type**  
dict

**References**

IAPWS, Advisory Note No. 5: Industrial Calculation of the Thermodynamic Properties of Seawater, http://www.iapws.org/relguide/Advise5.html, Eq 7

iapws.iapws08._OsmoticPressure\( (T, P, S) \)

Procedure to calculate the osmotic pressure of seawater

**Parameters**

• \( T \) (*float*) – Temperature, [K]
• \( P \) (*float*) – Pressure, [MPa]
• \( S \) (*float*) – Salinity, [kg/kg]

**Returns**  
\( \text{Posm} \) – Osmotic pressure, [MPa]

**Return type**  
float

**References**

IAPWS, Advisory Note No. 5: Industrial Calculation of the Thermodynamic Properties of Seawater, http://www.iapws.org/relguide/Advise5.html, Eq 15

iapws.iapws08._ThCond_SeaWater\( (T, P, S) \)

Equation for the thermal conductivity of seawater

**Parameters**

• \( T \) (*float*) – Temperature, [K]
• \( P \) (*float*) – Pressure, [MPa]
• \( S \) (*float*) – Salinity, [kg/kg]

**Returns**  
\( k \) – Thermal conductivity excess relative to that of the pure water, [W/mK]

**Return type**  
float

**Notes**

Raise `NotImplementedError` if input isn’t in limit:

• 273.15 \( T \) 523.15
• 0 \( P \) 140
• 0 \( S \) 0.17

**Examples**

```python
>>> _ThCond_SeaWater(293.15, 0.1, 0.035)
-0.00418604
```
References

iapws.iapws08._Tension_SeaWater(T, S)
Equation for the surface tension of seawater

Parameters

• T (float) – Temperature, [K]
• S (float) – Salinity, [kg/kg]

Returns \sigma – Surface tension, [N/m]

Return type float

Notes

Raise \texttt{NotImplementedError} if input isn’t in limit:

• 0 S 0.131 for 274.15 T 365.15
• 0 S 0.038 for 248.15 T 274.15

Examples

```python
>>> _Tension_SeaWater(253.15, 0.035)
-0.07922517961
```

References

iapws.iapws08._solNa2SO4(T, mH2SO4, mNaCl)
Equation for the solubility of sodium sulfate in aqueous mixtures of sodium chloride and sulfuric acid

Parameters

• T (float) – Temperature, [K]
• mH2SO4 (float) – Molality of sulfuric acid, [mol/kg(water)]
• mNaCl (float) – Molality of sodium chloride, [mol/kg(water)]

Returns S – Molal solubility of sodium sulfate, [mol/kg(water)]

Return type float

Notes

Raise \texttt{NotImplementedError} if input isn’t in limit:

• 523.15 T 623.15
• 0 mH2SO4 0.75
• 0 mNaCl 2.25
Examples

```python
>>> _solNa2SO4(523.15, 0.25, 0.75)
2.68
```

References

IAPWS, Solubility of Sodium Sulfate in Aqueous Mixtures of Sodium Chloride and Sulfuric Acid from Water to Concentrated Solutions, http://www.iapws.org/relguide/na2so4.pdf

```python
iapws.iapws08._critNaCl(x)
```

Equation for the critical locus of aqueous solutions of sodium chloride

**Parameters**

- `x (float)`: Mole fraction of NaCl, [-]

**Returns**

- `prop`:
  - A dictionary with the properties:
    - `Tc`: critical temperature, [K]
    - `Pc`: critical pressure, [MPa]
    - `rhoc`: critical density, [kg/m³]

**Return type**

`dict`

**Notes**

Raise `NotImplementedError` if input isn’t in limit:

- `0 ≤ x ≤ 0.12`

Examples

```python
>>> _critNaCl(0.1)
975.571016
```

References

### 5.1.6 iapws.ammonia module

Module with Ammonia-water mixture properties and related properties. The module include:

- `NH3`: Multiparameter equation of state for ammonia
- `H2ONH3`: Thermodynamic properties of ammonia-water mixtures
- `Ttr`: Triple point of ammonia-water mixtures
class iapws.ammonia.NH3(**kwargs)

Multiparameter equation of state for ammonia for internal procedures, see MEoS base class

Parameters

- **T** (*float*) – Temperature, [K]
- **P** (*float*) – Pressure, [MPa]
- **rho** (*float*) – Density, [kg/m³]
- **v** (*float*) – Specific volume, [m³/kg]
- **h** (*float*) – Specific enthalpy, [kJ/kg]
- **s** (*float*) – Specific entropy, [kJ/kgK]
- **u** (*float*) – Specific internal energy, [kJ/kg]
- **x** (*float*) – Vapor quality, [-]
- **l** (*float, optional*) – Wavelength of light, for refractive index, [nm]
- **rho0** (*float, optional*) – Initial value of density, to improve iteration, [kg/m³]
- **T0** (*float, optional*) – Initial value of temperature, to improve iteration, [K]
- **x0** (Initial value of vapor quality, necessary in bad input pair definition) – where there are two valid solution (T-h, T-s)

Notes

- It needs two incoming properties of T, P, rho, h, s, u.
- v as a alternate input parameter to rho
- T-x, P-x, preferred input pair to specified a point in two phases region

The calculated instance has the following properties:

- **P**: Pressure, [MPa]
- **T**: Temperature, [K]
- **x**: Vapor quality, [-]
- **g**: Specific Gibbs free energy, [kJ/kg]
- **a**: Specific Helmholtz free energy, [kJ/kg]
- **v**: Specific volume, [m³/kg]
- **r**: Density, [kg/m³]
- **h**: Specific enthalpy, [kJ/kg]
- **u**: Specific internal energy, [kJ/kg]
- **s**: Specific entropy, [kJ/kgK]
- **cp**: Specific isobaric heat capacity, [kJ/kg-K]
- **cv**: Specific isochoric heat capacity, [kJ/kg-K]
- **cp_cv**: Heat capacity ratio, [-]
- **Z**: Compression factor, [-]
• $f_i$: Fugacity coefficient, [-]
• $f$: Fugacity, [MPa]
• $\gamma$: Isoentropic exponent, [-]
• $\alpha_f$: Isobaric cubic expansion coefficient, [1/K]
• $\kappa$: Isothermal compressibility, [1/MPa]
• $\kappa_a$: Adiabatic compresibility, [1/MPa]
• $\alpha_f$: Relative pressure coefficient, [1/K]
• $\beta_p$: Isothermal stress coefficient, [kg/m$^3$]
• $\joule$: Joule-Thomson coefficient, [K/MPa]
• $\beta_s$: Isoentropic temperature-pressure coefficient, [-]
• $\Gruneisen$: Gruneisen parameter, [-]
• $\text{virialB}$: Second virial coefficient, [m$^3$/kg]
• $\text{virialC}$: Third virial coefficient, [m$^6$/kg$^2$]
• $dpdT_\rho$: Derivatives, $dp/dT$ at constant $\rho$, [MPa/K]
• $dpdrho_T$: Derivatives, $dp/d\rho$ at constant $T$, [MPa·m$^3$/kg]
• $d\rho dT_P$: Derivatives, $d\rho/dT$ at constant $P$, [kg/m$^3$·K]
• $d\rho dP_T$: Derivatives, $d\rho/dP$ at constant $T$, [kg/m$^3$·MPa]
• $dhdT_\rho$: Derivatives, $dh/dT$ at constant $\rho$, [kJ/kg·K]
• $dhdP_T$: Derivatives, $dh/dP$ at constant $T$, [kJ/kg·MPa]
• $dhdT_P$: Isothermal throttling coefficient, [kJ/kg·MPa]
• $dhdT_P$: Derivatives, $dh/dT$ at constant $P$, [kJ/kg·K]
• $dhdrho_T$: Derivatives, $dh/d\rho$ at constant $T$, [kJ·m$^3$/kg$^2$]
• $dhdrho_P$: Derivatives, $dh/d\rho$ at constant $P$, [kJ·m$^3$/kg$^2$]
• $dhdP_\rho$: Derivatives, $dh/dP$ at constant $\rho$, [kJ/kg·MPa]
• $k_t$: Isothermal Expansion Coefficient, [-]
• $k_s$: Adiabatic Compressibility, [1/MPa]
• $K_s$: Adiabatic bulk modulus, [MPa]
• $K_t$: Isothermal bulk modulus, [MPa]
• $v_0$: Ideal specific volume, [m$^3$/kg]
• $\rho_0$: Ideal gas density, [kg/m$^3$]
• $u_0$: Ideal specific internal energy, [kJ/kg]
• $h_0$: Ideal specific enthalpy, [kJ/kg]
• $s_0$: Ideal specific entropy, [kJ/kg·K]
• $a_0$: Ideal specific Helmholtz free energy, [kJ/kg]
• $g_0$: Ideal specific Gibbs free energy, [kJ/kg]
• $c_{p0}$: Ideal specific isobaric heat capacity, [kJ/kg·K]
• $c_{v0}$: Ideal specific isochoric heat capacity, [kJ/kg·K]
• $w_0$: Ideal speed of sound, [m/s]
• $\gamma_0$: Ideal isoentropic exponent, [-]
• $w$: Speed of sound, [m/s]
• $\mu$: Dynamic viscosity, [Pa·s]
• $\nu$: Kinematic viscosity, [m$^2$/s]
• $k$: Thermal conductivity, [W/m·K]
• $\alpha$: Thermal diffusivity, [m$^2$/s]
• $\sigma$: Surface tension, [N/m]
• $\varepsilon$: Dielectric constant, [-]
• $n$: Refractive index, [-]
• $\text{Prandt}$: Prandtl number, [-]
• $\text{Pr}$: Reduced Pressure, [-]
• $\text{Tr}$: Reduced Temperature, [-]
• $H_{\text{vap}}$: Vaporization heat, [kJ/kg]
• $S_{\text{vap}}$: Vaporization entropy, [kJ/kg·K]
• $Z_{\rho}$: $(Z - 1)/\rho$, [m$^3$/kg]
• $\text{IntP}$: Internal pressure, [MPa]
• $\text{invT}$: Negative reciprocal temperature, [1/K]
• $h_{\text{Input}}$: Specific heat input, [kJ/kg]

_visco(self, rho, T, fase=None) Equation for the Viscosity

Parameters
• rho (float) – Density [kg/m³]
• T (float) – Temperature [K]

Returns mu – Viscosity [Pa·s]

Return type float

References

_thermo (self, rho, T, fase)
Equation for the thermal conductivity

Parameters

- rho (float) – Density, [kg/m³]
- T (float) – Temperature, [K]
- fase (dict) – phase properties

Returns

k – Thermal conductivity [W/mK]

Return type

float

References

class iapws.ammonia.H2ONH3

_class iapws.ammonia.H2ONH3

__prop (self, rho, T, x)
Thermodynamic properties of ammonia-water mixtures

Parameters

- T (float) – Temperature [K]
- rho (float) – Density [kg/m³]
- x (float) – Mole fraction of ammonia in mixture [mol/mol]

Returns

prop –

Dictionary with thermodynamic properties of ammonia-water mixtures:

- M: Mixture molecular mass, [g/mol]
- P: Pressure, [MPa]
- u: Specific internal energy, [kJ/kg]
- s: Specific entropy, [kJ/kgK]
- h: Specific enthalpy, [kJ/kg]
- a: Specific Helmholtz energy, [kJ/kg]
- g: Specific gibbs energy, [kJ/kg]
- cv: Specific isochoric heat capacity, [kJ/kgK]
- cp: Specific isobaric heat capacity, [kJ/kgK]
- w: Speed of sound, [m/s]
- fugH2O: Fugacity of water, [-]
- fugNH3: Fugacity of ammonia, [-]

Return type
dict
References

\_phi0 (self, rho, T, x)
Ideal gas Helmholtz energy of binary mixtures and derivatives

**Parameters**

- **rho** (*float*) – Density, [kg/m^3]
- **T** (*float*) – Temperature, [K]
- **x** (*float*) – Mole fraction of ammonia in mixture, [mol/mol]

**Returns**

**prop** – Dictionary with ideal adimensional helmholtz energy and derivatives:

- **tau**: the adimensional temperature variable, [-]
- **delta**: the adimensional density variable, [-]
- **fio**, [-]
- **fiot**: \[fio/\tau\delta\] [-]
- **fiod**: \[fio/\delta\tau\] [-]
- **fiott**: \[2fio/\tau^2\delta\] [-]
- **fiodt**: \[2fio/\tau\delta\tau\] [-]
- **fiodd**: \[2fio/\delta^2\tau\] [-]

**Return type** dict

References

\_phir (self, rho, T, x)
Residual contribution to the free Helmholtz energy

**Parameters**

- **rho** (*float*) – Density, [kg/m^3]
- **T** (*float*) – Temperature, [K]
- **x** (*float*) – Mole fraction of ammonia in mixture, [mol/mol]

**Returns**

**prop** – dictionary with residual adimensional helmholtz energy and derivatives:

- **tau**: the adimensional temperature variable, [-]
- **delta**: the adimensional density variable, [-]
- **fir**, [-]
- **firt**: \[fir/\tau\delta,x\] [-]
- **fird**: \[fir/\delta\tau,x\] [-]
• firtt: \([\Delta \text{firt} / \tau^2] \delta, x\) [-]
• firdt: \([\Delta \text{firt} / \tau \delta] x\) [-]
• firdd: \([\Delta \text{firt} / \delta^2] \tau, x\) [-]
• firx: \([\text{firt}/x] \tau, \delta\) [-]
• F: Function for fugacity calculation, [-]

Return type dict

References

\_Dphirt\(\text{(self, tau, delta, x)}\)
Departure function to the residual contribution to the free Helmholtz energy

Parameters

• \textbf{tau} (float) – Adimensional temperature, [-]
• \textbf{delta} (float) – Adimensional density, [-]
• \textbf{x} (float) – Mole fraction of ammonia in mixture, [mol/mol]

Returns

\textbf{prop} – Dictionary with departure contribution to the residual adimensional helmholtz energy and derivatives:
• fir [-]
• firt: \([\Delta \text{firt} / \tau] \delta, x\) [-]
• fird: \([\Delta \text{firt} / \delta] \tau, x\) [-]
• firtt: \([\Delta \text{firt} / \tau^2] \delta, x\) [-]
• firdt: \([\Delta \text{firt} / \tau \delta] x\) [-]
• firdd: \([\Delta \text{firt} / \delta^2] \tau, x\) [-]
• firx: \([\text{firt}/x] \tau, \delta\) [-]

Return type dict

References

iapws.ammonia.\textbf{Ttr}\(\text{(x)}\)
Equation for the triple point of ammonia-water mixture

Parameters \textbf{x} (float) – Mole fraction of ammonia in mixture, [mol/mol]

Returns \textbf{Ttr} – Triple point temperature, [K]

Return type float
Notes

Raise \texttt{NotImplementedError} if input isn’t in limit:

• 0 x 1

References

5.1.7 iapws.humidAir module

Module with Air-water mixture properties and related properties. The module include:

• \texttt{\_virial()}: Virial equations for humid air
• \texttt{\_fugacity()}: Fugacity equation for humid air
• \texttt{MEoSBlend}: Special MEoS subclass to implement pseudocomponent blend with ancillary dew and bubble point
• \texttt{Air}: Multiparameter equation of state for Air as pseudocomponent
• \texttt{HumidAir}: Humid air mixture with complete functionality

\texttt{iapws.humidAir.\_virial} \( (T) \)

Virial equations for humid air

\textbf{Parameters} \( T (float) \) – Temperature [K]

\textbf{Returns}

prop –

Dictionary with critical coefficient:

• Baa: Second virial coefficient of dry air, \([m^3/mol]\]
• Baw: Second air-water cross virial coefficient, \([m^3/mol]\]
• Bww: Second virial coefficient of water, \([m^3/mol]\]
• Caaa: Third virial coefficient of dry air, \([m^6/mol]\]
• Caaw: Third air-water cross virial coefficient, \([m^6/mol]\]
• Caww: Third air-water cross virial coefficient, \([m^6/mol]\]
• Cwww: Third virial coefficient of dry air, \([m^6/mol]\]
• Bawt: dBaw/dT, \([m^3/molK]\]
• Bawtt: d\(^2\)Baw/dT\(^2\), \([m^3/molK^2]\]
• Caawt: dCaaw/dT, \([m^6/molK]\]
• Caawtt: d\(^2\)Caaw/dT\(^2\), \([m^6/molK^2]\]
• Cawwt: dCaww/dT, \([m^6/molK]\]
• Cawwtt: d\(^2\)Caww/dT\(^2\), \([m^6/molK^2]\]

\textbf{Return type} \ \texttt{dict}
Notes

Raise `Warning` if T isn't in range of validity:

- Baa: 60 T 2000
- Baw: 130 T 2000
- Bww: 130 T 1273
- Caaa: 60 T 2000
- Caaw: 193 T 493
- Caww: 173 T 473
- Cwww: 130 T 1273

Examples

```python
>>> _virial(200)['Baa']
-3.92722567e-5
```

References

IAPWS, Guideline on an Equation of State for Humid Air in Contact with Seawater and Ice, Consistent with the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, Table 10, http://www.iapws.org/relguide/SeaAir.html

`iapws.humidAir._fugacity(T, P, x)`

Fugacity equation for humid air

Parameters

- T (`float`) – Temperature, [K]
- P (`float`) – Pressure, [MPa]
- x (`float`) – Mole fraction of water-vapor, [-]

Returns `fv` – fugacity coefficient, [MPa]

Return type `float`

Notes

Raise `NotImplementedError` if input isn’t in range of validity:

- 193 T 473
- 0 P 5
- 0 x 1

Really the xmax is the xsaturation but isn’t implemented
Examples

```python
>>> _fugacity(300, 1, 0.1)
0.0884061686
```

Methods

__call__(self, **kwargs) Make instance callable to can add input parameter one to one

calculo(self) Calculate procedure
derivative(self, z, x, y, fase) Wrapper derivative for custom derived properties where x, y, z can be: P, T, v, rho, u, h, s, g, a

fill(self, fase, estado) Fill phase properties

classmethod _dewP(T) Using ancillary equation return the pressure of dew point

classmethod _bubbleP(T) Using ancillary equation return the pressure of bubble point

class iapws.humidAir.Air(**kwars) Multiparameter equation of state for Air as pseudocomponent for internal procedures, see MEoS base class

Parameters
• **T** (*float*) – Temperature, [K]
• **P** (*float*) – Pressure, [MPa]
• **rho** (*float*) – Density, [kg/m\(^3\)]
• **v** (*float*) – Specific volume, [m\(^3\)/kg]
• **h** (*float*) – Specific enthalpy, [kJ/kg]
• **s** (*float*) – Specific entropy, [kJ/kgK]
• **u** (*float*) – Specific internal energy, [kJ/kg]
• **x** (*float*) – Vapor quality, [-]
• **l** (*float, optional*) – Wavelength of light, for refractive index, [nm]
• **rho0** (*float, optional*) – Initial value of density, to improve iteration, [kg/m\(^3\)]
• **T0** (*float, optional*) – Initial value of temperature, to improve iteration, [K]
• **x0** (*Initial value of vapor quality, necessary in bad input pair definition*) – where there are two valid solution (T-h, T-s)

**Notes**

- It needs two incoming properties of T, P, rho, h, s, u.
- v as a alternate input parameter to rho
- T-x, P-x, preferred input pair to specified a point in two phases region

The calculated instance has the following properties:

• **P**: Pressure, [MPa]
• **T**: Temperature, [K]
• **x**: Vapor quality, [-]
• **g**: Specific Gibbs free energy, [kJ/kg]
• **a**: Specific Helmholtz free energy, [kJ/kg]
• **v**: Specific volume, [m\(^3\)/kg]
• **r**: Density, [kg/m\(^3\)]
• **h**: Specific enthalpy, [kJ/kg]
• **u**: Specific internal energy, [kJ/kg]
• **s**: Specific entropy, [kJ/kgK]
• **cp**: Specific isobaric heat capacity, [kJ/kg-K]
• **cv**: Specific isochoric heat capacity, [kJ/kg-K]
• **cp_cv**: Heat capacity ratio, [-]
• **Z**: Compression factor, [-]
• **fi**: Fugacity coefficient, [-]
• **f**: Fugacity, [MPa]
• **gamma**: Isoentropic exponent, [-]
• alfav: Isobaric cubic expansion coefficient, [1/K]
• kappa: Isothermal compressibility, [1/MPa]
• kappas: Adiabatic compressibility, [1/MPa]
• alfap: Relative pressure coefficient, [1/K]
• betap: Isothermal stress coefficient, [kg/m³]
• joule: Joule-Thomson coefficient, [K/MPa]
• betas: Isoentropic temperature-pressure coefficient, [-]
• Gruneisen: Gruneisen parameter, [-]
• virialB: Second virial coefficient, [m³/kg]
• virialC: Third virial coefficient, [m⁶/kg²]
• dpdT_rh: Derivatives, dp/dT at constant rho, [MPa/K]
• dpdρ_T: Derivatives, dp/dρ at constant T, [MPa·m³/kg]

_classmethod _Liquid_Density(T)
Auxiliary equation for the density or saturated liquid

Parameters T (float) – Temperature [K]

Returns rho – Saturated liquid density [kg/m³]

Return type float

static _visco(rho, T, fase=None)
Equation for the Viscosity

Parameters

• rho (float) – Density, [kg/m³]

• T (float) – Temperature, [K]

Returns μ – Viscosity, [Pa·s]

Return type float
References

__thermo__(self, rho, T, fase=None)

Equation for the thermal conductivity

**Parameters**

- **rho (float)** – Density, [kg/m³]
- **T (float)** – Temperature, [K]
- **fase (dict)** – phase properties

**Returns**

- **k** – Thermal conductivity, [W/mK]

**Return type**

float

References

class iapws.humidAir.HumidAir(**kwargs)

Humid air class with complete functionality

**Parameters**

- **T (float)** – Temperature, [K]
- **P (float)** – Pressure, [MPa]
- **rho (float)** – Density, [kg/m³]
- **v (float)** – Specific volume, [m³/kg]
- **A (float)** – Mass fraction of dry air in humid air, [kg/kg]
- **xa (float)** – Mole fraction of dry air in humid air, [-]
- **W (float)** – Mass fraction of water in humid air, [kg/kg]
- **xw (float)** – Mole fraction of water in humid air, [-]

**Notes**

- It needs two incoming properties of T, P, rho.
- v as a alternate input parameter to rho
- For composition need one of A, xa, W, xw.

The calculated instance has the following properties:

- **P**: Pressure, [MPa]
- **T**: Temperature, [K]
- **g**: Specific Gibbs free energy, [kJ/kg]
• a: Specific Helmholtz free energy, [kJ/kg]
• v: Specific volume, [m$^3$/kg]
• rho: Density, [kg/m$^3$]
• h: Specific enthalpy, [kJ/kg]
• u: Specific internal energy, [kJ/kg]
• s: Specific entropy, [kJ/kg·K]
• cp: Specific isobaric heat capacity, [kJ/kg·K]
• w: Speed of sound, [m/s]
• alfav: Isobaric cubic expansion coefficient, [1/K]
• betas: Isoentropic temperature-pressure coefficient, [-]
• xkappa: Isothermal Expansion Coefficient, [-]
• ks: Adiabatic Compressibility, [1/MPa]
• A: Mass fraction of dry air in humid air, [kg/kg]
• W: Mass fraction of water in humid air, [kg/kg]
• xa: Mole fraction of dry air, [-]
• xw: Mole fraction of water, [-]
• xa_sat: Mole fraction of dry air at saturation state, [-]
• mu: Relative chemical potential, [kJ/kg]
• muw: Chemical potential of water, [kJ/kg]
• M: Molar mass of humid air, [g/mol]
• HR: Humidity ratio, [-]
• RH: Relative humidity, [-]

**calculable** Check if inputs are enough to define state
calcualio *(self)*
Calculate procedure

derivative *(self, z, x, y)*
Wrapper derivative for custom derived properties where x, y, z can be: P, T, v, rho, u, h, s, g, a

_eq*(self, T, P)*
Procedure for calculate the composition in saturation state

Parameters
- T *(float)* – Temperature [K]
- P *(float)* – Pressure [MPa]

Returns Asat – Saturation mass fraction of dry air in humid air [kg/kg]

Return type float

_prop*(self, T, rho, fav)*
Thermodynamic properties of humid air

Parameters
- T *(float)* – Temperature, [K]
- rho *(float)* – Density, [kg/m³]
- fav *(dict)* – dictionary with helmholtz energy and derivatives

Returns
prop –
Dictionary with thermodynamic properties of humid air:
- P: Pressure, [MPa]
- s: Specific entropy, [kJ/kgK]
- cp: Specific isobaric heat capacity, [kJ/kgK]
- h: Specific enthalpy, [kJ/kg]

For a rapid usage demonstration, see this examples

IAPWS-IF97 (see full documentation)

```python
from iapws import IAPWS97
sat_steam=IAPWS97(P=1,x=1)  # saturated steam with known P
sat_liquid=IAPWS97(T=370, x=0)  # saturated liquid with known T
steam=IAPWS97(P=2.5, T=500)  # steam with known P and T
print(sat_steam.h, sat_liquid.h, steam.h)  # calculated enthalpies
```

IAPWS-95 (see full documentation)

```python
from iapws import IAPWS95
sat_steam=IAPWS95(P=1,x=1)  # saturated steam with known P
sat_liquid=IAPWS95(T=370, x=0)  # saturated liquid with known T
steam=IAPWS95(P=2.5, T=500)  # steam with known P and T
print(sat_steam.h, sat_liquid.h, steam.h)  # calculated enthalpies
```

IAPWS-17 for Heavy water (see full documentation)

```python
from iapws import D2O
sat_liquid=D2O(T=370, x=0)  # saturated liquid with known T
print(sat_liquid.h)  # calculated enthalpy
```

IAPWS-06 for Ice Ih (see full documentation)

```python
from iapws import _Ice
ice=_Ice(273.15, 0.101325)  # Ice at normal melting point
print(ice["rho"]))  # Calculated density
```

IAPWS-08 for seawater (see full documentation)

```python
from iapws import SeaWater
state = SeaWater(T=300, P=0.101325, S=0.001)  # Seawater with 0.1% Salinity
print(state.cp)  # Get cp
```

5.1. iapws package
• FIXME: Electrolytic conductivity

• TODO: Improve convergence in two phase region for IAPWS95 and D2O class

• TODO: Implement SBTL method for fast calculation

• TODO: Implement TTSE method for fast calculation

Ammonia-water mixture:

• FIXME: Ammonia-water mixture residual helmholtz. The values are good, bad differ by 1%

• TODO: Add equilibrium routine

I’ve tried to test all code and use all values for computer verification the standards give, but anyway the code can have hidden problem. For any suggestions, comments, bugs . . . you can usage the github issue section, or contact directly with me at email.
Python implementation of standard from IAPWS (http://www.iapws.org/release.html).

- **Home**: https://github.com/jjgomera/iapws
- **Author**: Juan José Gómez Romera <jjgomera@gmail.com>
- **License**: GPL-3
- **Documentation**: http://iapws.readthedocs.io/
CHAPTER 8

Dependences

- python 2x, 3x, compatible with both versions
- Numpy-scipy: library with mathematic and scientific tools
CHAPTER 9

Installation

In debian you can find in official repositories in jessie, testing and sid. In ubuntu it’s in official repositories from ubuntu saucy (13.10). In other system you can install using pip:

```bash
git clone https://github.com/jjgomera/iapws.git
```

and adding the folder to a python path.
CHAPTER 10

Features

This module implements almost the full set of standards:

Releases:

- R1-76(2014): Revised Release on the Surface Tension of Ordinary Water Substance, `iapws._iapws._Tension()`
- R2-83(1992): Release on the Values of Temperature, Pressure and Density of Ordinary and Heavy Water Substances at their Respective Critical Points, `iapws._iapws()`
- R4-84(2007): Revised Release on Viscosity and Thermal Conductivity of Heavy Water Substance, `iapws._iapws._D2O_Viscosity(),iapws._iapws._D2O_ThCond()`
- R5-85(1994): Release on Surface Tension of Heavy Water Substance, `iapws._iapws._D2O_Tension()`
- R8-97: Release on the Static Dielectric Constant of Ordinary Water Substance for Temperatures from 238 K to 873 K and Pressures up to 1000 MPa, `iapws._iapws._Dielectric()`
- R9-97: Release on the Refractive Index of Ordinary Water Substance as a Function of Wavelength, Temperature and Pressure, `iapws._iapws._Refractive()`
- R12-08: Release on the IAPWS Formulation 2008 for the Viscosity of Ordinary Water Substance, `iapws._iapws._Viscosity()`
- R13-08: Release on the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, `iapws.iapws08()`
• R14-08(2011): Revised Release on the Pressure along the Melting and Sublimation Curves of Ordinary Water Substance, \texttt{iapws\_iapws\_Melting\_Pressure()}, \texttt{iapws\_iapws\_Sublimation\_Pressure()}

• R15-11: Release on the IAPWS Formulation 2011 for the Thermal Conductivity of Ordinary Water Substance, \texttt{iapws\_iapws\_ThCond()}

Supplementary Releases:

• SR1-86(1992): Revised Supplementary Release on Saturation Properties of Ordinary Water Substance, \texttt{iapws.iapws95.MEoS\_Liquid\_Density()}, \texttt{iapws.iapws95.MEoS\_Vapor\_Density()}, \texttt{iapws.iapws95.MEoS\_Vapor\_Pressure()}

• SR2-01(2014): Revised Supplementary Release on Backward Equations for Pressure as a Function of Enthalpy and Entropy \(p(h,s)\) for Regions 1 and 2 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \texttt{iapws.iapws97\_Backward1\_P\_hs()}, \texttt{iapws.iapws97\_Backward2\_P\_hs()}

• SR3-03(2014): Revised Supplementary Release on Backward Equations for the Functions \(T(p,h), v(p,h),\) and \(T(p,s), v(p,s)\) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \texttt{iapws.iapws97\_Backward3\_T\_Ph()}, \texttt{iapws.iapws97\_Backward3\_T\_Ps()}, \texttt{iapws.iapws97\_Backward3\_v\_Ph()}, \texttt{iapws.iapws97\_Backward3\_v\_Ps()}

• SR4-04(2014): Revised Supplementary Release on Backward Equations \(p(h,s)\) for Region 3, Equations as a Function of \(h\) and \(s\) for the Region Boundaries, and an Equation \(Ts_{at}(h,s)\) for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \texttt{iapws.iapws97\_Backward3\_P\_hs()}

• SR5-05(2016): Revised Supplementary Release on Backward Equations for Specific Volume as a Function of Pressure and Temperature \(v(p,T)\) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam, \texttt{iapws.iapws97\_Backward3\_v\_PT()}

• SR6-08(2011): Revised Supplementary Release on Properties of Liquid Water at 0.1 MPa, \texttt{iapws\_iapws\_Liquid()}

• SR7-09: Supplementary Release on a Computationally Efficient Thermodynamic Formulation for Liquid Water for Oceanographic Use, \texttt{iapws.iapws08\_SeaWater\_waterSupp()}

Guidelines:

• G1-90: Electrolytic Conductivity (Specific Conductance) of Liquid and Dense Supercritical Water from 0°C to 800°C and Pressures up to 1000 MPa, \texttt{iapws\_iapws\_Conductivity()}

• G2-90(1994): Solubility of Sodium Sulfate in Aqueous Mixtures of Sodium Chloride and Sulfuric Acid from Water to Concentrated Solutions, from 250 °C to 350 °C, \texttt{iapws.iapws08\_SolNa2SO4()}

• G3-00(2012): Revised Guideline on the Critical Locus of Aqueous Solutions of Sodium Chloride, \texttt{iapws.iapws08\_critNaCl()}

• G4-01: Guideline on the IAPWS Formulation 2001 for the Thermodynamic Properties of Ammonia-Water Mixtures, \texttt{iapws.ammonia()}

• G5-01(2016): Guideline on the Use of Fundamental Physical Constants and Basic Constants of Water, \texttt{iapws\_iapws()}

• G6-03: Guideline on the Tabular Taylor Series Expansion (TTSE) Method for Calculation of Thermodynamic Properties of Water and Steam Applied to IAPWS-95 as an Example (Not implemented)

• G7-04: Guideline on the Henry's Constant and Vapor-Liquid Distribution Constant for Gases in H2O and D2O at High Temperatures, \texttt{iapws\_iapws\_Henry()}, \texttt{iapws\_iapws\_Kvalue()}
• G8-10: Guideline on an Equation of State for Humid Air in Contact with Seawater and Ice, Consistent with the IAPWS Formulation 2008 for the Thermodynamic Properties of Seawater, \( iapws.humidAir().HumidAir() \)

• G9-12: Guideline on a Low-Temperature Extension of the IAPWS-95 Formulation for Water Vapor, \( iapws.iapws95.IAPWS95._phiex() \)

• G10-15: Guideline on the Thermal Conductivity of Seawater, \( iapws.iapws08._ThCond_SeaWater() \)

• G11-15: Guideline on a Virial Equation for the Fugacity of H2O in Humid Air, \( iapws.humidAir._virial() \)

• G12-15: Guideline on Thermodynamic Properties of Supercooled Water, \( iapws._iapws._Supercooled() \)

• G13-15: Guideline on the Fast Calculation of Steam and Water Properties with the Spline-Based Table Look-Up Method (SBTL) (Not implemented)

• G14-19: Guideline on the Surface Tension of Seawater, \( iapws.iapws08._Tension_SeaWater() \)

Advisory Notes:

• AN1-03: Uncertainties in Enthalpy for the IAPWS Formulation 1995 for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use (IAPWS-95) and the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam (IAPWS-IF97)

• AN2-04(2013): Role of Various IAPWS Documents Concerning the Thermodynamic Properties of Ordinary Water Substance

• AN3-07(2018): Thermodynamic Derivatives from IAPWS Formulations, \( iapws._utils.deriv_G(), iapws._utils.deriv_H() \)

• AN4-09: Roles of IAPWS and CIPM Standards for the Density of Water

• AN5-13(2016): Industrial Calculation of the Thermodynamic Properties of Seawater, \( iapws.iapws08.Seawater._waterIF97(), iapws.iapws08._Tb(), iapws.iapws08._Tf(), iapws.iapws08._Triple(),iapws.iapws08._OsmoticPressure() \)

• AN6-16: Relationship between Various IAPWS Documents and the International Thermodynamic Equation of Seawater - 2010 (TEOS-10)
You can navigate the full documentation of package:

For a rapid usage demostration, see this examples

**IAPWS-IF97 (see full documentation)**

```python
from iapws import IAPWS97
sat_steam=IAPWS97(P=1,x=1)  #saturated steam with known P
sat_liquid=IAPWS97(T=370, x=0)  #saturated liquid with known T
steam=IAPWS97(P=2.5, T=500)  #steam with known P and T
print(sat_steam.h, sat_liquid.h, steam.h)  #calculated enthalpies
```

**IAPWS-95 (see full documentation)**

```python
from iapws import IAPWS95
sat_steam=IAPWS95(P=1,x=1)  #saturated steam with known P
sat_liquid=IAPWS95(T=370, x=0)  #saturated liquid with known T
steam=IAPWS95(P=2.5, T=500)  #steam with known P and T
print(sat_steam.h, sat_liquid.h, steam.h)  #calculated enthalpies
```

**IAPWS-17 for Heavy water (see full documentation)**

```python
from iapws import D2O
sat_liquid=D2O(T=370, x=0)  #saturated liquid with known T
print(sat_liquid.h)  #calculated enthalpy
```

**IAPWS-06 for Ice Ih (see full documentation)**

```python
from iapws import _Ice
ice=_Ice(273.15, 0.101325)  #Ice at normal melting point
print(ice["rho"])  #Calculated density
```

**IAPWS-08 for seawater (see full documentation)**
from iapws import SeaWater
state = SeaWater(T=300, P=0.101325, S=0.001)  # Seawater with 0.1% Salinity
print(state.cp)  # Get cp
• FIXME: Electrolytic conductivity
• TODO: Improve convergence in two phase region for IAPWS95 and D2O class
• TODO: Implement SBTL method for fast calculation
• TODO: Implement TTSE method for fast calculation

Ammonia-water mixture:
• FIXME: Ammonia-water mixture residual helmholtz. The values are good, bad differ by 1%
• TODO: Add equilibrium routine

I’ve tried to test all code and use all values for computer verification the standards give, but anyway the code can have hidden problem. For any suggestions, comments, bugs ... you can usage the github issue section, or contact directly with me at email.
